6.30.1	Detailed Description	67
6.30.2	Constructor & Destructor Documentation	67
6.30.3	Member Function Documentation	68
6.31	dng_exif Class Reference	68
6.31.1	Detailed Description	71
6.31.2	Member Function Documentation	71
6.32	dng_fast_interpolator Class Reference	74
6.32.1	Member Function Documentation	74
6.33	dng_file_stream Class Reference	75
6.33.1	Detailed Description	75
6.33.2	Constructor & Destructor Documentation	75
6.34	dng_filter_opcode Class Reference	76
6.34.1	Detailed Description	77
6.34.2	Member Function Documentation	77
6.35	dng_filter_opcode_task Class Reference	78
6.35.1	Member Function Documentation	79
6.36	dng_filter_task Class Reference	80
6.36.1	Detailed Description	81

6.36.2	Constructor & Destructor Documentation	81
6.36.3	Member Function Documentation	81
6.37	dng_filter_warp Class Reference	83
6.37.1	Member Function Documentation	84
6.38	dng_find_new_raw_image_digest_task Class Reference	85
6.38.1	Member Function Documentation	85
6.39	dng_fingerprint Class Reference	86
6.39.1	Detailed Description	87
6.39.2	Member Function Documentation	87
6.40	dng_fingerprint_less_than Struct Reference	87
6.40.1	Detailed Description	87
6.41	dng_function_exposure_ramp Class Reference	88
6.41.1	Detailed Description	88
6.41.2	Member Function Documentation	88
6.42	dng_function_exposure_tone Class Reference	89
6.42.1	Detailed Description	89
6.43	dng_function_gamma_encode Class Reference	89
6.43.1	Detailed Description	90
6.43.2	Member Function Documentation	90
6.44	dng_function_GammaEncode_1_8 Class Reference	90
6.44.1	Detailed Description	91
6.44.2	Member Function Documentation	91
6.45	dng_function_GammaEncode_2_2 Class Reference	91
6.45.1	Detailed Description	92
6.45.2	Member Function Documentation	92
6.46	dng_function_GammaEncode_sRGB Class Reference	93
6.46.1	Detailed Description	93
6.46.2	Member Function Documentation	93
6.47	dng_gain_map Class Reference	94
6.47.1	Detailed Description	95
6.47.2	Constructor & Destructor Documentation	95
6.47.3	Member Function Documentation	95
6.48	dng_gain_map_interpolator Class Reference	95
6.49	dng_gamma_encode_proxy Class Reference	95
6.49.1	Member Function Documentation	96
6.50	dng_host Class Reference	96
6.50.1	Detailed Description	98

6.50.2	Constructor & Destructor Documentation	98
6.50.3	Member Function Documentation	98
6.51	dng_hue_sat_map Class Reference	102
6.51.1	Detailed Description	103
6.51.2	Member Function Documentation	103
6.52	dng_ifd Class Reference	104
6.52.1	Detailed Description	107
6.53	dng_image Class Reference	107
6.53.1	Detailed Description	109
6.53.2	Member Enumeration Documentation	109
6.53.3	Member Function Documentation	109
6.54	dng_image_preview Class Reference	112
6.55	dng_image_spooler Class Reference	112
6.56	dng_image_writer Class Reference	112
6.56.1	Detailed Description	114
6.56.2	Member Function Documentation	114
6.57	dng_info Class Reference	116
6.57.1	Detailed Description	117
6.57.2	Member Function Documentation	117
6.58	dng_inplace_opcode Class Reference	118
6.58.1	Detailed Description	119
6.58.2	Member Function Documentation	119
6.59	dng_inplace_opcode_task Class Reference	120
6.59.1	Member Function Documentation	120
6.60	dng_iptc Class Reference	121
6.60.1	Detailed Description	122
6.60.2	Member Function Documentation	122
6.61	dng_jpeg_image Class Reference	123
6.62	dng_jpeg_image_encode_task Class Reference	124
6.62.1	Member Function Documentation	124
6.63	dng_jpeg_image_find_digest_task Class Reference	125
6.63.1	Member Function Documentation	125
6.64	dng_jpeg_preview Class Reference	126
6.65	dng_jpeg_preview_tag_set Class Reference	126
6.66	dng_limit_float_depth_task Class Reference	127
6.66.1	Member Function Documentation	127
6.67	dng_linearization_info Class Reference	128

6.67.1 Detailed Description	129
6.67.2 Member Function Documentation	129
6.67.3 Member Data Documentation	130
6.68 dng_linearize_image Class Reference	131
6.68.1 Member Function Documentation	131
6.69 dng_linearize_plane Class Reference	132
6.70 dng_lock_mutex Class Reference	132
6.71 dng_lossless_decoder Class Reference	132
6.72 dng_lossless_encoder Class Reference	133
6.73 dng_lzw_compressor Class Reference	133
6.74 dng_lzw_expander Class Reference	133
6.75 dng_malloc_block Class Reference	133
6.76 dng_mask_preview Class Reference	134
6.77 dng_matrix Class Reference	134
6.77.1 Detailed Description	135
6.78 dng_matrix_3by3 Class Reference	135
6.78.1 Detailed Description	136
6.79 dng_matrix_4by3 Class Reference	136
6.79.1 Detailed Description	136
6.80 dng_md5_printer Class Reference	137
6.80.1 Detailed Description	137
6.80.2 Member Function Documentation	137
6.81 dng_md5_printer_stream Class Reference	138
6.81.1 Detailed Description	138
6.82 dng_memory_allocator Class Reference	138
6.82.1 Detailed Description	139
6.82.2 Member Function Documentation	139
6.83 dng_memory_block Class Reference	139
6.83.1 Detailed Description	140
6.83.2 Member Function Documentation	140
6.84 dng_memory_data Class Reference	144
6.84.1 Detailed Description	145
6.84.2 Constructor & Destructor Documentation	145
6.84.3 Member Function Documentation	145
6.85 dng_memory_stream Class Reference	150
6.85.1 Detailed Description	151
6.85.2 Constructor & Destructor Documentation	151

6.85.3	Member Function Documentation	151
6.86	dng_metadata Class Reference	151
6.86.1	Detailed Description	153
6.86.2	Member Function Documentation	153
6.87	dng_mosaic_info Class Reference	153
6.87.1	Detailed Description	154
6.87.2	Member Function Documentation	154
6.87.3	Member Data Documentation	156
6.88	dng_mutex Class Reference	157
6.89	dng_negative Class Reference	157
6.89.1	Detailed Description	166
6.89.2	Member Function Documentation	166
6.90	dng_noise_function Class Reference	168
6.90.1	Detailed Description	169
6.90.2	Member Function Documentation	169
6.91	dng_noise_profile Class Reference	169
6.91.1	Detailed Description	170
6.92	dng_opcode Class Reference	170
6.92.1	Detailed Description	171
6.92.2	Member Enumeration Documentation	171
6.92.3	Member Function Documentation	172
6.93	dng_opcode_DeltaPerColumn Class Reference	172
6.93.1	Detailed Description	173
6.93.2	Constructor & Destructor Documentation	173
6.93.3	Member Function Documentation	173
6.94	dng_opcode_DeltaPerRow Class Reference	174
6.94.1	Detailed Description	175
6.94.2	Constructor & Destructor Documentation	175
6.94.3	Member Function Documentation	175
6.95	dng_opcode_FixBadPixelsConstant Class Reference	176
6.95.1	Detailed Description	177
6.95.2	Constructor & Destructor Documentation	177
6.95.3	Member Function Documentation	177
6.96	dng_opcode_FixBadPixelsList Class Reference	179
6.96.1	Detailed Description	179
6.96.2	Constructor & Destructor Documentation	180
6.96.3	Member Function Documentation	180

6.97 dng_opcode_FixVignetteRadial Class Reference	181
6.97.1 Detailed Description	182
6.97.2 Member Function Documentation	182
6.98 dng_opcode_GainMap Class Reference	184
6.98.1 Detailed Description	184
6.98.2 Constructor & Destructor Documentation	184
6.98.3 Member Function Documentation	185
6.99 dng_opcode_list Class Reference	185
6.99.1 Detailed Description	186
6.99.2 Member Function Documentation	186
6.100dng_opcode_MapPolynomial Class Reference	187
6.100.1 Detailed Description	187
6.100.2 Constructor & Destructor Documentation	187
6.100.3 Member Function Documentation	187
6.101dng_opcode_MapTable Class Reference	188
6.101.1 Detailed Description	189
6.101.2 Constructor & Destructor Documentation	189
6.101.3 Member Function Documentation	189
6.102dng_opcode_ScalePerColumn Class Reference	190
6.102.1 Detailed Description	191
6.102.2 Constructor & Destructor Documentation	191
6.102.3 Member Function Documentation	191
6.103dng_opcode_ScalePerRow Class Reference	192
6.103.1 Detailed Description	193
6.103.2 Constructor & Destructor Documentation	193
6.103.3 Member Function Documentation	193
6.104dng_opcode_TrimBounds Class Reference	194
6.104.1 Detailed Description	194
6.104.2 Member Function Documentation	194
6.105dng_opcode_Unknown Class Reference	195
6.105.1 Detailed Description	195
6.105.2 Member Function Documentation	195
6.106dng_opcode_WarpFisheye Class Reference	196
6.106.1 Detailed Description	196
6.106.2 Member Function Documentation	196
6.107dng_opcode_WarpRectilinear Class Reference	197
6.107.1 Detailed Description	198

6.107.2 Member Function Documentation	198
6.108dng_orientation Class Reference	198
6.109dng_pixel_buffer Class Reference	199
6.109.1 Detailed Description	201
6.109.2 Member Function Documentation	201
6.110dng_point Class Reference	211
6.111dng_point_real64 Class Reference	211
6.112dng_preview Class Reference	212
6.113dng_preview_info Class Reference	212
6.114dng_preview_list Class Reference	213
6.115dng_preview_tag_set Class Reference	213
6.116dng_raw_preview Class Reference	213
6.117dng_raw_preview_tag_set Class Reference	214
6.118dng_read_image Class Reference	214
6.118.1 Member Function Documentation	215
6.119dng_read_tiles_task Class Reference	216
6.119.1 Member Function Documentation	216
6.120dng_rect Class Reference	216
6.121dng_rect_real64 Class Reference	217
6.122dng_ref_counted_block Class Reference	218
6.122.1 Detailed Description	219
6.122.2 Constructor & Destructor Documentation	219
6.122.3 Member Function Documentation	220
6.123dng_render Class Reference	223
6.123.1 Detailed Description	224
6.123.2 Constructor & Destructor Documentation	224
6.123.3 Member Function Documentation	225
6.124dng_render_task Class Reference	227
6.124.1 Member Function Documentation	228
6.125dng_resample_bicubic Class Reference	229
6.126dng_resample_coords Class Reference	230
6.127dng_resample_function Class Reference	230
6.128dng_resample_task Class Reference	231
6.128.1 Member Function Documentation	231
6.129dng_resample_weights Class Reference	233
6.130dng_resample_weights_2d Class Reference	233
6.131dng_resolution Class Reference	234

6.131.1 Detailed Description	234
6.132dng_row_interleaved_image Class Reference	234
6.133dng_set_minimum_priority Class Reference	234
6.133.1 Detailed Description	235
6.134dng_shared Class Reference	235
6.135dng_simple_image Class Reference	236
6.135.1 Detailed Description	237
6.136dng_sniffer_task Class Reference	237
6.136.1 Detailed Description	238
6.136.2 Constructor & Destructor Documentation	238
6.136.3 Member Function Documentation	238
6.137dng_space_AdobeRGB Class Reference	239
6.137.1 Detailed Description	239
6.138dng_space_ColorMatch Class Reference	240
6.138.1 Detailed Description	240
6.139dng_space_fakeRGB Class Reference	240
6.140dng_space_GrayGamma18 Class Reference	241
6.140.1 Detailed Description	241
6.141dng_space_GrayGamma22 Class Reference	241
6.141.1 Detailed Description	242
6.142dng_space_ProPhoto Class Reference	242
6.142.1 Detailed Description	243
6.143dng_space_sRGB Class Reference	243
6.143.1 Detailed Description	243
6.144dng_spline_solver Class Reference	244
6.144.1 Member Function Documentation	244
6.145dng_spooler Class Reference	245
6.146dng_srational Class Reference	245
6.147dng_stream Class Reference	245
6.147.1 Detailed Description	247
6.147.2 Constructor & Destructor Documentation	247
6.147.3 Member Function Documentation	248
6.148dng_string Class Reference	259
6.149dng_string_list Class Reference	260
6.150dng_suite Struct Reference	261
6.151dng_temperature Class Reference	262
6.152dng_tiff_directory Class Reference	262

6.153dng_tile_buffer Class Reference	263
6.153.1 Detailed Description	263
6.153.2 Constructor & Destructor Documentation	264
6.154dng_tile_iterator Class Reference	264
6.155dng_time_zone Class Reference	264
6.155.1 Detailed Description	265
6.156dng_timer Class Reference	265
6.157dng_tone_curve Class Reference	265
6.158dng_tone_curve_acr3_default Class Reference	265
6.158.1 Detailed Description	266
6.159dng_unlock_mutex Class Reference	266
6.160dng_urational Class Reference	266
6.161dng_vector Class Reference	267
6.161.1 Detailed Description	268
6.162dng_vector_3 Class Reference	268
6.162.1 Detailed Description	268
6.163dng_vector_4 Class Reference	268
6.163.1 Detailed Description	269
6.164dng_vignette_radial_function Class Reference	269
6.164.1 Member Function Documentation	269
6.165dng_vignette_radial_params Class Reference	270
6.165.1 Detailed Description	270
6.166dng_warp_params Class Reference	270
6.166.1 Detailed Description	271
6.166.2 Constructor & Destructor Documentation	272
6.166.3 Member Function Documentation	272
6.167dng_warp_params_fisheye Class Reference	273
6.167.1 Detailed Description	274
6.167.2 Constructor & Destructor Documentation	274
6.167.3 Member Function Documentation	275
6.168dng_warp_params_rectilinear Class Reference	276
6.168.1 Detailed Description	277
6.168.2 Constructor & Destructor Documentation	277
6.168.3 Member Function Documentation	277

1 Adobe Digital Negative SDK 1.4

1.1 Introduction

Digital Negative (DNG) is a non-proprietary file format for camera raw image data and metadata. A wide variety of cameras and sensor types are supported by DNG, using the same documented file layout.

This SDK provides support for reading and writing DNG files as well as support for converting DNG data into a displayable or processible image. This SDK is intended to serve as a starting point for adding DNG support to existing applications that use and manipulate images.

1.2 Command line validation: dng_validate

A good place to start investigating the DNG SDK is the `dng_validate` command line tool, which can read, validate and convert an existing DNG file. The `dng_validate.cpp` file demonstrates a number of common uses of the SDK. Documentation for the tool can be found [here](#).

1.3 Starting points

- [dng_host](#) Used to customize memory allocation, to communicate progress updates and test for cancellation.
- [dng_negative](#) Main container for metadata and image data in a DNG file.
- [dng_image](#) Class used to hold and manipulate image data.
- [dng_render](#) Class used to convert DNG RAW data to displayable image data.
- [dng_image_writer](#) Class used to write DNG files.

2 doc_dng_validate

`dng_validate` Version 1.4 22-Jun-2012

“`dng_validate`” is a command-line tool that parses the tag structure of DNG (and other TIFF-EP based format) files, and reports any deviations from the DNG specification that it finds.

The usage syntax is:

```
dng_validate [-v] [-d <number>] [-f] [-b4] [-s <CFA index>] [-q <target-binned-width>] [-cs1|-cs2|-cs3|-cs4|-cs5|-cs6]
[-16] { [-1 <stage1-out-filename> ] [-2 <stage2-out-filename> ] [-3 <stage3-out-filename> ] [-tif <TIFF-out-filename>]
[-dng <DNG-out-file>] {<list of files>}*
```

Any deviations from the DNG specification are written to the standard error stream.

The “-v” option turns on “verbose” mode, which writes the parsed tag structure to the standard output stream. Any tags that are not parsed by this tool are preceded by an asterisk.

The “-d <number>” option both implies verbose mode, and also specifies the maximum number of lines of data displayed per tag.

The “-f” option switches dng_validate to using floating-point math where possible, instead of the default 16-bit integer.

The “-b4” option causes the demosaic algorithm to produce a four-channel output rather than a three-channel one. (The input DNG must be a three-channel Bayer pattern image.) This option is only useful when used with the -3 switch. The extra channel is the result of doing two interpolations of the Bayer green channel such that the greens on the same row as the reds produces one channel and the greens on the same row as the blues produce another channel. The second green channel will be the highest numbered channel in the output. This option is used to gauge the difference between greens in each row to decide whether the DNG BayerGreenSplit tag should be used for a given source of image data (e.g. camera).

The “-s <CFA index>” option chooses which set of color filter arrays to use when there are multiple ones for an input image. Each CFA array is a separate channel in the DNG input. This applies to the Fuji SR cameras for example, where the first channel is from the S-sensing elements and the second channel is from the R-sensing elements. The S elements are more sensitive and the R elements are less so with the goal of using both to increase the dynamic range the sensor can capture in a single image. By default dng_validate generates an image from only the S-sensors. By using “-s 1” the R-sensing elements’ data can be used to construct the output image. (This index is 0-based. The default is 0.)

The “-q <target-binned-size>” option enables binning during the demosaic process. This is useful for creating previews or thumbnails. The binning factor is determined from the target-binned-size, which is the size in pixels of the larger dimension of the image that is desired. An integer binning factor will be computed to produce an image of that size or larger. For example, if the input image is 3008 x 2000 pixels and the target-binned-width is 700, factor of 4 binning will be used and the result output image (after demosaicing) will be 752 x 500 pixels.

The “-cs1” option generates the output image in sRGB color space.

The “-cs2” option generates the output image in AdobeRGB color space.

The “-cs3” option generates the output image in ProPhotoRGB color space.

The “-cs4” option generates the output image in ColorMatch color space.

The “-cs5” option generates the output image in grayscale gamma 1.8 color space.

The “-cs6” option generates the output image in a grayscale gamma 2.2 color space.

The “-16” option causes dng_validate to output 16-bit-per-component images rather than the default 8-bit.

The “-1” option causes the unprocessed raw image data to be written to the named output file. This applies only to the next input file after the switch.

The “-2” option causes the image data after linearization and black/white level mapping to be written to the named output file. This applies only to the next input file after the switch.

The “-3” option causes the image data after demosaic processing, but prior to color space conversion, noise reduction, sharpening, etc., to be written to the named output file. This applies only to the next input file after the switch.

The “-tif” option causes the final rendered image to be written as TIFF to the named output file. This applies only to the next input file after the switch.

The “-dng” option causes the parsed DNG data to be reserialized and written to the named output file. This mostly serves to provide an example code path for the process of writing a DNG file, as the output may not differ significantly

from the input DNG. (Parameters, such as whether the data is compressed or not, may vary between the input and output DNG files.) This applies only to the next input file after the switch.

4 Class Index

4.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

AutoArray< T >	
A class intended to be used similarly to AutoPtr but for arrays	23
AutoPtr< T >	
A class intended to be used in stack scope to hold a pointer from new. The held pointer will be deleted automatically if the scope is left without calling Release on the AutoPtr first	24
color_tag_set	26
DecompressInfo	26
dng_1d_concatenate	
A dng_1d_function that represents the composition (curry) of two other dng_1d_functions	27
dng_1d_function	
A 1D floating-point function	29
dng_1d_identity	
An identity (x -> y such that x == y for all x) mapping function	30
dng_1d_inverse	
A dng_1d_function that represents the inverse of another dng_1d_function	31
dng_1d_table	
A 1D floating-point lookup table using linear interpolation	32
dng_abort_sniffer	
Class for signaling user cancellation and receiving progress updates	34
dng_area_spec	
A class to describe an area of an image, including a pixel subrectangle, plane range, and row/column pitch (e.g., for mosaic images). Useful for specifying opcodes that only apply to specific color planes or pixel types (e.g., only one of the two green Bayer pixels)	35

dng_area_task	
Abstract class for rectangular processing operations with support for partitioning across multiple processing resources and observing memory constraints	37
dng_bad_pixel_list	
A list of bad pixels and rectangles (usually single rows or columns)	41
dng_basic_tag_set	44
dng_bilinear_interpolator	44
dng_bilinear_kernel	44
dng_bilinear_pattern	45
dng_camera_profile	
Container for DNG camera color profile and calibration data	45
dng_camera_profile_id	
An ID for a camera profile consisting of a name and optional fingerprint	53
dng_camera_profile_info	56
dng_color_space	
An abstract color space	57
dng_color_spec	58
dng_const_tile_buffer	
Class to get resource acquisition is instantiation behavior for constant (read-only) tile buffers	60
dng_date_time	
Class for holding a date/time and converting to and from relevant date/time formats	61
dng_date_time_info	
Class for holding complete data/time/zone information	63
dng_date_time_storage_info	
Store file offset from which date was read	63
dng_dirty_tile_buffer	
Class to get resource acquisition is instantiation behavior for dirty (writable) tile buffers	65
dng_dither	65
dng_encode_proxy_task	66
dng_exception	
All exceptions thrown by the DNG SDK use this exception class	67
dng_exif	
Container class for parsing and holding EXIF tags	68
dng_fast_interpolator	74
dng_file_stream	
A stream to/from a disk file. See dng_stream for read/write interface	75

dng_filter_opcode	76
Class to represent a filter opcode, such as a convolution	
dng_filter_opcode_task	78
dng_filter_task	80
Represents a task which filters an area of a source dng_image to an area of a destination dng_image	
dng_filter_warp	83
dng_find_new_raw_image_digest_task	85
dng_fingerprint	86
Container fingerprint (MD5 only at present)	
dng_fingerprint_less_than	87
Utility to compare fingerprints (e.g., for sorting)	
dng_function_exposure_ramp	88
Curve for pre-exposure-compensation adjustment based on noise floor, shadows, and highlight level	
dng_function_exposure_tone	89
Exposure compensation curve for a given compensation amount in stops using quadric for roll-off	
dng_function_gamma_encode	89
Encoding gamma curve for a given color space	
dng_function_GammaEncode_1_8	90
A dng_1d_function for gamma encoding with 1.8 gamma	
dng_function_GammaEncode_2_2	91
A dng_1d_function for gamma encoding with 2.2 gamma	
dng_function_GammaEncode_sRGB	93
A dng_1d_function for gamma encoding in sRGB color space	
dng_gain_map	94
Holds a discrete (i.e., sampled) 2D representation of a gain map. This is effectively an image containing scale factors	
dng_gain_map_interpolator	95
dng_gamma_encode_proxy	95
dng_host	96
The main class for communication between the application and the DNG SDK. Used to customize memory allocation and other behaviors	
dng_hue_sat_map	102
A 3D table that maps HSV (hue, saturation, and value) floating-point input coordinates in the range [0,1] to delta signals. The table must have at least 1 sample in the hue dimension, at least 2 samples in the saturation dimension, and at least 1 sample in the value dimension. Tables are stored in value-hue-saturation order	

dng_ifd	
Container for a single image file directory of a digital negative	104
dng_image	
Base class for holding image data in DNG SDK. See dng_simple_image for derived class most often used in DNG SDK	107
dng_image_preview	112
dng_image_spooler	112
dng_image_writer	
Support for writing dng_image or dng_negative instances to a dng_stream in TIFF or DNG format	112
dng_info	
Top-level structure of DNG file with access to metadata	116
dng_inplace_opcode	
Class to represent an in-place (i.e., pointwise, per-pixel) opcode, such as a global tone curve	118
dng_inplace_opcode_task	120
dng_iptc	
Class for reading and holding IPTC metadata associated with a DNG file	121
dng_jpeg_image	123
dng_jpeg_image_encode_task	124
dng_jpeg_image_find_digest_task	125
dng_jpeg_preview	126
dng_jpeg_preview_tag_set	126
dng_limit_float_depth_task	127
dng_linearization_info	
Class for managing data values related to DNG linearization	128
dng_linearize_image	131
dng_linearize_plane	132
dng_lock_mutex	132
dng_lossless_decoder	132
dng_lossless_encoder	133
dng_lzw_compressor	133
dng_lzw_expander	133
dng_malloc_block	133
dng_mask_preview	134

dng_matrix	Class to represent 2D matrix up to kMaxColorPlanes x kMaxColorPlanes in size	134
dng_matrix_3by3	A 3x3 matrix	135
dng_matrix_4by3	A 4x3 matrix. Handy for working with 4-color cameras	136
dng_md5_printer	Class to hash binary data to a fingerprint using the MD5 Message-Digest Algorithm	137
dng_md5_printer_stream	A dng_stream based interface to the MD5 printing logic	138
dng_memory_allocator	Interface for dng_memory_block allocator	138
dng_memory_block	Class to provide resource acquisition is instantiation discipline for image buffers and other larger memory allocations	139
dng_memory_data	Class to provide resource acquisition is instantiation discipline for small memory allocations	144
dng_memory_stream	A dng_stream which can be read from or written to memory	150
dng_metadata	Main class for holding metadata	151
dng_mosaic_info	Support for describing color filter array patterns and manipulating mosaic sample data	153
dng_mutex		157
dng_negative	Main class for holding DNG image data and associated metadata	157
dng_noise_function	Noise model for photon and sensor read noise, assuming that they are independent random variables and spatially invariant	168
dng_noise_profile	Noise profile for a negative	169
dng_opcode	Virtual base class for opcode	170
dng_opcode_DeltaPerColumn	An opcode to apply a delta (i.e., offset) that varies per column. Within a column, the same delta value is applied to all specified pixels	172
dng_opcode_DeltaPerRow	An opcode to apply a delta (i.e., offset) that varies per row. Within a row, the same delta value is applied to all specified pixels	174

dng_opcode_FixBadPixelsConstant	
An opcode to fix individual bad pixels that are marked with a constant value (e.g., 0) in a Bayer image	176
dng_opcode_FixBadPixelsList	
An opcode to fix lists of bad pixels (indicated by position) in a Bayer image	179
dng_opcode_FixVignetteRadial	
Radially-symmetric lens vignette correction opcode	181
dng_opcode_GainMap	
An opcode to fix 2D spatially-varying light falloff or color casts (i.e., uniformity issues). This is commonly due to shading	184
dng_opcode_list	
A list of opcodes	185
dng_opcode_MapPolynomial	
An opcode to apply a 1D function (represented as a polynomial) to an image area	187
dng_opcode_MapTable	
An opcode to apply a 1D function (represented as a 16-bit table) to an image area	188
dng_opcode_ScalePerColumn	
An opcode to apply a scale factor that varies per column. Within a column, the same scale factor is applied to all specified pixels	190
dng_opcode_ScalePerRow	
An opcode to apply a scale factor that varies per row. Within a row, the same scale factor is applied to all specified pixels	192
dng_opcode_TrimBounds	
Opcode to trim image to a specified rectangle	194
dng_opcode_Unknown	
Class to represent unknown opcodes (e.g, opcodes defined in future DNG versions)	195
dng_opcode_WarpFisheye	
Warp opcode for fisheye camera model	196
dng_opcode_WarpRectilinear	
Warp opcode for pinhole perspective (rectilinear) camera model	197
dng_orientation	198
dng_pixel_buffer	
Holds a buffer of pixel data with "pixel geometry" metadata	199
dng_point	211
dng_point_real64	211
dng_preview	212
dng_preview_info	212
dng_preview_list	213

dng_preview_tag_set	213
dng_raw_preview	213
dng_raw_preview_tag_set	214
dng_read_image	214
dng_read_tiles_task	216
dng_rect	216
dng_rect_real64	217
dng_ref_counted_block	
Class to provide resource acquisition is instantiation discipline for small memory allocations	218
dng_render	
Class used to render digital negative to displayable image	223
dng_render_task	227
dng_resample_bicubic	229
dng_resample_coords	230
dng_resample_function	230
dng_resample_task	231
dng_resample_weights	233
dng_resample_weights_2d	233
dng_resolution	
Image resolution	234
dng_row_interleaved_image	234
dng_set_minimum_priority	
Convenience class for setting thread priority level to minimum	234
dng_shared	235
dng_simple_image	
Dng_image derived class with simple Trim and Rotate functionality	236
dng_sniffer_task	
Class to establish scope of a named subtask in DNG processing	237
dng_space_AdobeRGB	
Singleton class for AdobeRGB color space	239
dng_space_ColorMatch	
Singleton class for ColorMatch color space	240
dng_space_fakeRGB	240

dng_space_GrayGamma18	
Singleton class for gamma 1.8 grayscale color space	241
dng_space_GrayGamma22	
Singleton class for gamma 2.2 grayscale color space	241
dng_space_ProPhoto	
Singleton class for ProPhoto RGB color space	242
dng_space_sRGB	
Singleton class for sRGB color space	243
dng_spline_solver	244
dng_spooler	245
dng_srational	245
dng_stream	245
dng_string	259
dng_string_list	260
dng_suite	261
dng_temperature	262
dng_tiff_directory	262
dng_tile_buffer	
Class to get resource acquisition is instantiation behavior for tile buffers. Can be dirty or constant tile access	263
dng_tile_iterator	264
dng_time_zone	
Class for holding a time zone	264
dng_timer	265
dng_tone_curve	265
dng_tone_curve_acr3_default	
Default ACR3 tone curve	265
dng_unlock_mutex	266
dng_urational	266
dng_vector	
Class to represent 1-dimensional vector with up to kMaxColorPlanes components	267
dng_vector_3	
A 3-element vector	268
dng_vector_4	
A 4-element vector	268

dng_vignette_radial_function	269
dng_vignette_radial_params	
Radially-symmetric vignette (peripheral illuminational falloff) correction parameters	270
dng_warp_params	
Abstract base class holding common warp opcode parameters (e.g., number of planes, optical center) and common warp routines	270
dng_warp_params_fisheye	
Warp parameters for fisheye camera model (radial component only). Note the restrictions described below	273
dng_warp_params_rectilinear	
Warp parameters for pinhole perspective rectilinear (not fisheye) camera model. Supports radial and tangential (decentering) distortion correction parameters	276
dng_write_tiles_task	278
dng_xmp	279
dng_xmp_namespace	281
dng_xmp_private	281
dng_xmp_sdk	282

6 Class Documentation

6.1 [AutoArray< T >](#) Class Template Reference

A class intended to be used similarly to [AutoPtr](#) but for arrays.

```
#include <dng_auto_ptr.h>
```

Public Member Functions

- [AutoArray](#) (T *p_=0)
- [~AutoArray](#) ()
Reset is called on destruction.
- T * [Release](#) ()
- void [Reset](#) (T *p_=0)
- T & [operator\[\]](#) (ptrdiff_t i) const
- T * [Get](#) () const

6.1.1 Detailed Description

```
template<typename T>class AutoArray< T >
```

A class intended to be used similarly to [AutoPtr](#) but for arrays.

6.1.2 Constructor & Destructor Documentation

6.1.2.1 `template<typename T> AutoArray< T >::AutoArray (T * p_ = 0) [inline], [explicit]`

Construct an [AutoArray](#) which owns the argument pointer.

Parameters

<code>p</code>	array pointer which constructed AutoArray takes ownership of. <code>p</code> will be deleted on destruction or <code>Reset</code> unless <code>Release</code> is called first.
----------------	--

6.1.3 Member Function Documentation

6.1.3.1 `template<typename T> T* AutoArray< T >::Get () const [inline]`

Return the owned pointer of this [AutoArray](#), NULL if none. No change in ownership or other effects occur.

Referenced by `dng_read_image::Read()`.

6.1.3.2 `template<typename T> T& AutoArray< T >::operator[] (ptrdiff_t i) const [inline]`

Allows indexing into the [AutoArray](#). It is an error to call this if the [AutoArray](#) has NULL as its value.

6.1.3.3 `template<typename T> T* AutoArray< T >::Release () [inline]`

Return the owned array pointer of this [AutoArray](#), NULL if none. The [AutoArray](#) gives up ownership and takes NULL as its value.

6.1.3.4 `template<typename T> void AutoArray< T >::Reset (T * p_ = 0) [inline]`

If a pointer is owned, it is deleted. Ownership is taken of passed in pointer.

Parameters

<code>p</code>	array pointer which constructed AutoArray takes ownership of. <code>p</code> will be deleted on destruction or <code>Reset</code> unless <code>Release</code> is called first.
----------------	--

Referenced by `dng_jpeg_image_encode_task::Process()`, `dng_read_image::Read()`, and `dng_find_new_raw_image_digest_task::Start()`.

The documentation for this class was generated from the following file:

- [dng_auto_ptr.h](#)

6.2 `AutoPtr< T >` Class Template Reference

A class intended to be used in stack scope to hold a pointer from `new`. The held pointer will be deleted automatically if the scope is left without calling `Release` on the [AutoPtr](#) first.

```
#include <dng_auto_ptr.h>
```

Public Member Functions

- [AutoPtr](#) ()
Construct an [AutoPtr](#) with no referent.
- [AutoPtr](#) (T *p)
- [~AutoPtr](#) ()
Reset is called on destruction.
- void [Alloc](#) ()
Call Reset with a pointer from new. Uses T's default constructor.

- `T * Get () const`
- `T * Release ()`
- `void Reset (T *p)`
- `void Reset ()`
- `T * operator-> () const`
- `T & operator* () const`

Friends

- `void Swap (AutoPtr< T > &x, AutoPtr< T > &y)`
Swap with another auto ptr.

6.2.1 Detailed Description

`template<class T>class AutoPtr< T >`

A class intended to be used in stack scope to hold a pointer from new. The held pointer will be deleted automatically if the scope is left without calling `Release` on the `AutoPtr` first.

6.2.2 Constructor & Destructor Documentation

6.2.2.1 `template<class T> AutoPtr< T >::AutoPtr (T * p) [inline],[explicit]`

Construct an `AutoPtr` which owns the argument pointer.

Parameters

<code>p</code>	pointer which constructed <code>AutoPtr</code> takes ownership of. <code>p</code> will be deleted on destruction or <code>Reset</code> unless <code>Release</code> is called first.
----------------	---

6.2.3 Member Function Documentation

6.2.3.1 `template<class T> T* AutoPtr< T >::Get () const [inline]`

Return the owned pointer of this `AutoPtr`, NULL if none. No change in ownership or other effects occur.

Referenced by `dng_linearization_info::ColumnBlack()`, `dng_linearization_info::ColumnBlackCount()`, `dng_render::dng_render()`, `dng_info::IsValidDNG()`, `dng_linearization_info::MaxBlackLevel()`, `dng_info::Parse()`, `dng_info::PostParse()`, `dng_render_task::ProcessArea()`, `dng_opcode_Unknown::PutData()`, `dng_read_image::Read()`, `dng_render::Render()`, `dng_linearization_info::RowBlack()`, `dng_linearization_info::RowBlackCount()`, and `dng_image_writer::WriteDNG()`.

6.2.3.2 `template<class T> T& AutoPtr< T >::operator* () const [inline]`

Returns a reference to the object that the owned pointer points to. It is an error to call this if the `AutoPtr` has NULL as its value.

6.2.3.3 `template<class T> T* AutoPtr< T >::operator-> () const [inline]`

Allows members of the owned pointer to be accessed directly. It is an error to call this if the `AutoPtr` has NULL as its value.

6.2.3.4 `template<class T> T * AutoPtr< T >::Release ()`

Return the owned pointer of this [AutoPtr](#), NULL if none. The [AutoPtr](#) gives up ownership and takes NULL as its value.

Referenced by `dng_opcode_list::Append()`, `dng_filter_opcode::Apply()`, `dng_opcode_WarpRectilinear::Apply()`, `dng_opcode_WarpFisheye::Apply()`, `dng_opcode_DeltaPerColumn::dng_opcode_DeltaPerColumn()`, `dng_opcode_DeltaPerRow::dng_opcode_DeltaPerRow()`, `dng_opcode_FixBadPixelsList::dng_opcode_FixBadPixelsList()`, `dng_opcode_GainMap::dng_opcode_GainMap()`, `dng_opcode_ScalePerColumn::dng_opcode_ScalePerColumn()`, `dng_opcode_ScalePerRow::dng_opcode_ScalePerRow()`, `dng_gain_map::GetStream()`, `dng_hue_sat_map::Interpolate()`, `dng_read_image::Read()`, and `dng_render::Render()`.

6.2.3.5 `template<class T> void AutoPtr< T >::Reset (T * p)`

If a pointer is owned, it is deleted. Ownership is taken of passed in pointer.

Parameters

<i>p</i>	pointer which constructed AutoPtr takes ownership of. <i>p</i> will be deleted on destruction or <code>Reset</code> unless <code>Release</code> is called first.
----------	--

Referenced by `dng_filter_opcode::Apply()`, `dng_opcode_WarpRectilinear::Apply()`, `dng_opcode_WarpFisheye::Apply()`, `dng_gain_map::dng_gain_map()`, `dng_opcode_DeltaPerColumn::dng_opcode_DeltaPerColumn()`, `dng_opcode_DeltaPerRow::dng_opcode_DeltaPerRow()`, `dng_opcode_GainMap::dng_opcode_GainMap()`, `dng_opcode_MapTable::dng_opcode_MapTable()`, `dng_opcode_ScalePerColumn::dng_opcode_ScalePerColumn()`, `dng_opcode_ScalePerRow::dng_opcode_ScalePerRow()`, `dng_render::dng_render()`, `dng_1d_table::Initialize()`, `dng_info::Parse()`, `dng_opcode_FixVignetteRadial::Prepare()`, `dng_jpeg_image_encode_task::Process()`, `dng_read_tiles_task::Process()`, `dng_write_tiles_task::Process()`, `dng_read_image::Read()`, `dng_render::Render()`, `dng_render_task::Start()`, `dng_find_new_raw_image_digest_task::Start()`, and `dng_image_writer::WriteDNG()`.

6.2.3.6 `template<class T> void AutoPtr< T >::Reset ()`

If a pointer is owned, it is deleted and the [AutoPtr](#) takes NULL as its value.

The documentation for this class was generated from the following file:

- [dng_auto_ptr.h](#)

6.3 color_tag_set Class Reference

Public Member Functions

- **color_tag_set** ([dng_tiff_directory](#) &directory, const [dng_negative](#) &negative)

The documentation for this class was generated from the following file:

- [dng_image_writer.cpp](#)

6.4 DecompressInfo Struct Reference

Public Attributes

- int32 **imageWidth**
- int32 **imageHeight**
- int32 **dataPrecision**

- [JpegComponentInfo](#) * **compInfo**
- int16 **numComponents**
- [JpegComponentInfo](#) * **curCompInfo** [4]
- int16 **compsInScan**
- int16 **MCUmembership** [10]
- [HuffmanTable](#) * **dcHuffTblPtrs** [4]
- int32 **Ss**
- int32 **Pt**
- int32 **restartInterval**
- int32 **restartInRows**
- int32 **restartRowsToGo**
- int16 **nextRestartNum**

The documentation for this struct was generated from the following file:

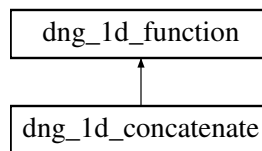

- dng_lossless_jpeg.cpp

6.5 dng_1d_concatenate Class Reference

A [dng_1d_function](#) that represents the composition (curry) of two other dng_1d_functions.

```
#include <dng_1d_function.h>
```

Inheritance diagram for dng_1d_concatenate:

Public Member Functions

- [dng_1d_concatenate](#) (const [dng_1d_function](#) &function1, const [dng_1d_function](#) &function2)
- virtual bool [IsIdentity](#) () const
Only true if both function1 and function2 have IsIdentity equal to true.
- virtual real64 [Evaluate](#) (real64 x) const
- virtual real64 [EvaluateInverse](#) (real64 y) const

Protected Attributes

- const [dng_1d_function](#) & **fFunction1**
- const [dng_1d_function](#) & **fFunction2**

6.5.1 Detailed Description

A [dng_1d_function](#) that represents the composition (curry) of two other dng_1d_functions.

6.5.2 Constructor & Destructor Documentation

6.5.2.1 `dng_1d_concatenate::dng_1d_concatenate (const dng_1d_function & function1, const dng_1d_function & function2)`

Create a [dng_1d_function](#) which computes $y = \text{function2.Evaluate}(\text{function1.Evaluate}(x))$. Compose function1 and function2 to compute $y = \text{function2.Evaluate}(\text{function1.Evaluate}(x))$. The range of function1.Evaluate must be a subset of 0.0 to 1.0 inclusive, otherwise the result of function1(x) will be pinned (clipped) to 0.0 if < 0.0 and to 1.0 if > 1.0 .

Parameters

<i>function1</i>	Inner function of composition.
<i>function2</i>	Outer function of composition.

6.5.3 Member Function Documentation

6.5.3.1 `real64 dng_1d_concatenate::Evaluate (real64 x) const [virtual]`

Return the composed mapping for value x.

Parameters

<i>x</i>	A value between 0.0 and 1.0 (inclusive).
----------	--

Return values

<i>function2.- Evaluate(function1.- Evaluate(x)).</i>	
---	--

Implements [dng_1d_function](#).

References `dng_1d_function::Evaluate()`.

6.5.3.2 `real64 dng_1d_concatenate::EvaluateInverse (real64 y) const [virtual]`

Return the reverse mapped value for y. Be careful using this method with compositions where the inner function does not have a range 0.0 to 1.0. (Or better yet, do not use such functions.)

Parameters

<i>y</i>	A value to reverse map. Should be within the range of function2.Evaluate.
----------	---

Return values

<i>A</i>	value x such that $\text{function2.Evaluate}(\text{function1.Evaluate}(x)) == y$ (to very close approximation).
----------	---

Reimplemented from [dng_1d_function](#).

References `dng_1d_function::EvaluateInverse()`.

The documentation for this class was generated from the following files:

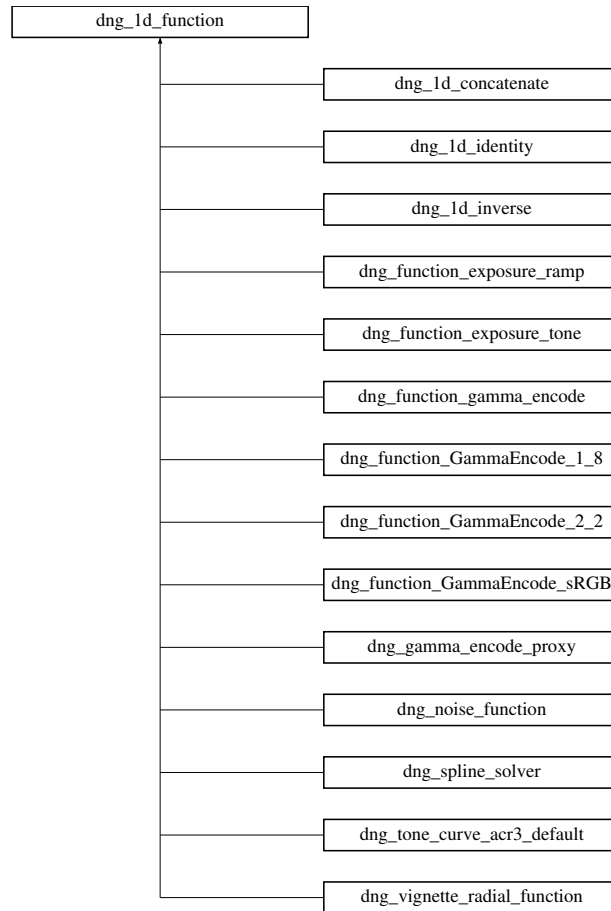

- [dng_1d_function.h](#)
- [dng_1d_function.cpp](#)

6.6 dng_1d_function Class Reference

A 1D floating-point function.

```
#include <dng_1d_function.h>
```

Inheritance diagram for dng_1d_function:

Public Member Functions

- virtual bool [IsIdentity](#) () const
Returns true if this function is the map $x \rightarrow y$ such that $x == y$ for all x . That is if $Evaluate(x) == x$ for all x .
- virtual real64 [Evaluate](#) (real64 x) const =0
- virtual real64 [EvaluateInverse](#) (real64 y) const

6.6.1 Detailed Description

A 1D floating-point function.

The domain (input) is always from 0.0 to 1.0, while the range (output) can be an arbitrary interval.

6.6.2 Member Function Documentation

6.6.2.1 virtual real64 dng_1d_function::Evaluate (real64 x) const [pure virtual]

Return the mapping for value x. This method must be implemented by a derived class of [dng_1d_function](#) and the derived class determines the lookup method and function used.

Parameters

x	A value between 0.0 and 1.0 (inclusive).
---	--

Return values

<i>Mapped</i>	value for x
---------------	-------------

Implemented in [dng_gamma_encode_proxy](#), [dng_vignette_radial_function](#), [dng_1d_inverse](#), [dng_function_gamma_encode](#), [dng_1d_concatenate](#), [dng_noise_function](#), [dng_tone_curve_acr3_default](#), [dng_function_exposure_tone](#), [dng_1d_identity](#), [dng_spline_solver](#), [dng_function_GammaEncode_2_2](#), [dng_function_exposure_ramp](#), [dng_function_GammaEncode_1_8](#), and [dng_function_GammaEncode_sRGB](#).

Referenced by [dng_1d_concatenate::Evaluate\(\)](#), [EvaluateInverse\(\)](#), [dng_1d_inverse::EvaluateInverse\(\)](#), and [dng_color_space::GammaEncode\(\)](#).

6.6.2.2 real64 dng_1d_function::EvaluateInverse (real64 y) const [virtual]

Return the reverse mapped value for y. This method can be implemented by derived classes. The default implementation uses Newton's method to solve for x such that Evaluate(x) == y.

Parameters

y	A value to reverse map. Should be within the range of the function implemented by this dng_1d_function .
---	--

Return values

A	value x such that Evaluate(x) == y (to very close approximation).
---	---

Reimplemented in [dng_1d_inverse](#), [dng_1d_concatenate](#), [dng_tone_curve_acr3_default](#), [dng_1d_identity](#), [dng_function_GammaEncode_2_2](#), [dng_function_GammaEncode_1_8](#), and [dng_function_GammaEncode_sRGB](#).

References Evaluate().

Referenced by [dng_1d_inverse::Evaluate\(\)](#), [dng_1d_concatenate::EvaluateInverse\(\)](#), and [dng_color_space::GammaDecode\(\)](#).

The documentation for this class was generated from the following files:

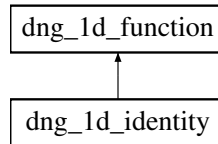

- [dng_1d_function.h](#)
- [dng_1d_function.cpp](#)

6.7 dng_1d_identity Class Reference

An identity (x -> y such that x == y for all x) mapping function.

```
#include <dng_1d_function.h>
```

Inheritance diagram for [dng_1d_identity](#):

Public Member Functions

- virtual bool [IsIdentity](#) () const
Always returns true for this class.
- virtual real64 [Evaluate](#) (real64 x) const
Always returns x for this class.
- virtual real64 [EvaluateInverse](#) (real64 y) const
Always returns y for this class.

Static Public Member Functions

- static const [dng_1d_function](#) & [Get](#) ()
This class is a singleton, and is entirely threadsafe. Use this method to get an instance of the class.

6.7.1 Detailed Description

An identity ($x \rightarrow y$ such that $x == y$ for all x) mapping function.

The documentation for this class was generated from the following files:

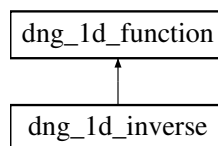

- [dng_1d_function.h](#)
- [dng_1d_function.cpp](#)

6.8 dng_1d_inverse Class Reference

A [dng_1d_function](#) that represents the inverse of another [dng_1d_function](#).

```
#include <dng_1d_function.h>
```

Inheritance diagram for dng_1d_inverse:

Public Member Functions

- **dng_1d_inverse** (const [dng_1d_function](#) &f)
- virtual bool [IsIdentity](#) () const
Returns true if this function is the map $x \rightarrow y$ such that $x == y$ for all x . That is if $Evaluate(x) == x$ for all x .
- virtual real64 [Evaluate](#) (real64 x) const
- virtual real64 [EvaluateInverse](#) (real64 y) const

Protected Attributes

- const [dng_1d_function](#) & **fFunction**

6.8.1 Detailed Description

A [dng_1d_function](#) that represents the inverse of another [dng_1d_function](#).

6.8.2 Member Function Documentation

6.8.2.1 `real64 dng_1d_inverse::Evaluate (real64 x) const` [virtual]

Return the mapping for value x. This method must be implemented by a derived class of [dng_1d_function](#) and the derived class determines the lookup method and function used.

Parameters

x	A value between 0.0 and 1.0 (inclusive).
---	--

Return values

<i>Mapped</i>	value for x
---------------	-------------

Implements [dng_1d_function](#).

References `dng_1d_function::EvaluateInverse()`.

6.8.2.2 `real64 dng_1d_inverse::EvaluateInverse (real64 y) const` [virtual]

Return the reverse mapped value for y. This method can be implemented by derived classes. The default implementation uses Newton's method to solve for x such that `Evaluate(x) == y`.

Parameters

y	A value to reverse map. Should be within the range of the function implemented by this dng_1d_function .
---	--

Return values

A	value x such that <code>Evaluate(x) == y</code> (to very close approximation).
---	--

Reimplemented from [dng_1d_function](#).

References `dng_1d_function::Evaluate()`.

The documentation for this class was generated from the following files:

- [dng_1d_function.h](#)
- [dng_1d_function.cpp](#)

6.9 dng_1d_table Class Reference

A 1D floating-point lookup table using linear interpolation.

```
#include <dng_1d_table.h>
```

Public Types

- enum { **kTableBits** = 12, **kTableSize** = (1 << kTableBits) }
Constants denoting size of table.

Public Member Functions

- void **Initialize** (dng_memory_allocator &allocator, const dng_1d_function &function, bool subSample=false)
- real32 **Interpolate** (real32 x) const
- const real32 * **Table** () const
Direct access function for table data.
- void **Expand16** (uint16 *table16) const
Expand the table to a 16-bit to 16-bit table.

Protected Attributes

- AutoPtr< dng_memory_block > **fBuffer**
- real32 * **fTable**

6.9.1 Detailed Description

A 1D floating-point lookup table using linear interpolation.

6.9.2 Member Function Documentation

6.9.2.1 void dng_1d_table::Initialize (dng_memory_allocator & allocator, const dng_1d_function & function, bool subSample = false)

Set up table, initialize entries using function. This method can throw an exception, e.g. if there is not enough memory.

Parameters

<i>allocator</i>	Memory allocator from which table memory is allocated.
<i>function</i>	Table is initialized with values of function.Evaluate(0.0) to function.Evaluate(1.0).
<i>subSample</i>	If true, only sample the function a limited number of times and interpolate.

References dng_memory_allocator::Allocate(), dng_memory_block::Buffer_real32(), and AutoPtr< T >::Reset().

Referenced by dng_opcode_FixVignetteRadial::Prepare(), and dng_render_task::Start().

6.9.2.2 real32 dng_1d_table::Interpolate (real32 x) const [inline]

Lookup and interpolate mapping for an input.

Parameters

<i>x</i>	value from 0.0 to 1.0 used as input for mapping
----------	---

Return values

<i>Approximation</i>	of function.Evaluate(x)
----------------------	-------------------------

References DNG_ASSERT.

Referenced by dng_opcode_FixVignetteRadial::Prepare().

- [dng_1d_table.cpp](#)

6.10 dng_abort_sniffer Class Reference

Class for signaling user cancellation and receiving progress updates.

```
#include <dng_abort_sniffer.h>
```

Public Member Functions

- [dng_priority](#) [Priority](#) () const
Getter for priority level.
- void [SetPriority](#) ([dng_priority](#) priority)
Setter for priority level.
- void [SniffNoPriorityWait](#) ()
- virtual bool [ThreadSafe](#) () const

Static Public Member Functions

- static void [SniffForAbort](#) ([dng_abort_sniffer](#) *sniffer)

Protected Member Functions

- virtual void [Sniff](#) ()=0
- virtual void [StartTask](#) (const char *name, real64 fract)
- virtual void [EndTask](#) ()
Signals the end of the innermost task that has been started.
- virtual void [UpdateProgress](#) (real64 fract)

Friends

- class [dng_sniffer_task](#)

6.10.1 Detailed Description

Class for signaling user cancellation and receiving progress updates.

DNG SDK clients should derive a host application specific implementation from this class.

6.10.2 Member Function Documentation

6.10.2.1 virtual void dng_abort_sniffer::Sniff () [protected], [pure virtual]

Should be implemented by derived classes to check for an user cancellation.

Referenced by SniffForAbort().

6.10.2.2 void dng_abort_sniffer::SniffForAbort (dng_abort_sniffer * *sniffer*) [static]

Check for pending user cancellation or other abort. ThrowUserCanceled will be called if one is pending. This static method is provided as a convenience for quickly testing for an abort and throwing an exception if one is pending.

Parameters

<i>sniffer</i>	The dng_sniffer to test for a pending abort. Can be NULL, in which case there an abort is never signalled.
----------------	--

References Priority(), and Sniff().

Referenced by dng_stream::Flush(), dng_stream::Get(), dng_jpeg_image_encode_task::Process(), dng_jpeg_image_find_digest_task::Process(), dng_read_tiles_task::Process(), dng_write_tiles_task::Process(), dng_area_task::ProcessOnThread(), dng_stream::Put(), and dng_sniffer_task::Sniff().

6.10.2.3 void dng_abort_sniffer::StartTask (const char * *name*, real64 *fract*) [protected], [virtual]

Signals the start of a named task withn processing in the DNG SDK. Tasks may be nested.

Parameters

<i>name</i>	of the task
<i>fract</i>	Percentage of total processing this task is expected to take. From 0.0 to 1.0 .

Referenced by dng_sniffer_task::dng_sniffer_task().

6.10.2.4 void dng_abort_sniffer::UpdateProgress (real64 *fract*) [protected], [virtual]

Signals progress made on current task.

Parameters

<i>fract</i>	percentage of processing completed on current task. From 0.0 to 1.0 .
--------------	---

Referenced by dng_sniffer_task::UpdateProgress().

The documentation for this class was generated from the following files:

- [dng_abort_sniffer.h](#)
- [dng_abort_sniffer.cpp](#)

6.11 dng_area_spec Class Reference

A class to describe an area of an image, including a pixel subrectangle, plane range, and row/column pitch (e.g., for mosaic images). Useful for specifying opcodes that only apply to specific color planes or pixel types (e.g., only one of the two green Bayer pixels).

```
#include <dng_misc_opcodes.h>
```

Public Types

- enum { **kDataSize** = 32 }

Public Member Functions

- [dng_area_spec](#) (const [dng_rect](#) &area=[dng_rect](#)(), uint32 plane=0, uint32 planes=1, uint32 rowPitch=1, uint32 colPitch=1)
Create an empty area.
- const [dng_rect](#) & [Area](#) () const
The pixel area.
- const uint32 [Plane](#) () const
The first plane.
- const uint32 [Planes](#) () const
The total number of planes.
- const uint32 [RowPitch](#) () const
The row pitch (i.e., stride). A pitch of 1 means all rows.
- const uint32 [ColPitch](#) () const
The column pitch (i.e., stride). A pitch of 1 means all columns.
- void [GetData](#) ([dng_stream](#) &stream)
Read area data from the specified stream.
- void [PutData](#) ([dng_stream](#) &stream) const
Write area data to the specified stream.
- [dng_rect](#) [Overlap](#) (const [dng_rect](#) &tile) const

6.11.1 Detailed Description

A class to describe an area of an image, including a pixel subrectangle, plane range, and row/column pitch (e.g., for mosaic images). Useful for specifying opcodes that only apply to specific color planes or pixel types (e.g., only one of the two green Bayer pixels).

6.11.2 Member Function Documentation

6.11.2.1 [dng_rect](#) [dng_area_spec::Overlap](#) (const [dng_rect](#) & *tile*) const

Compute and return pixel area overlap (i.e., intersection) between this area and the specified tile.

Referenced by [dng_opcode_MapTable::ModifiedBounds\(\)](#), [dng_opcode_GainMap::ModifiedBounds\(\)](#), [dng_opcode_MapPolynomial::ModifiedBounds\(\)](#), [dng_opcode_DeltaPerRow::ModifiedBounds\(\)](#), [dng_opcode_DeltaPerColumn::ModifiedBounds\(\)](#), [dng_opcode_ScalePerRow::ModifiedBounds\(\)](#), [dng_opcode_ScalePerColumn::ModifiedBounds\(\)](#), [dng_opcode_MapTable::ProcessArea\(\)](#), [dng_opcode_GainMap::ProcessArea\(\)](#), [dng_opcode_MapPolynomial::ProcessArea\(\)](#), [dng_opcode_DeltaPerRow::ProcessArea\(\)](#), [dng_opcode_DeltaPerColumn::ProcessArea\(\)](#), [dng_opcode_ScalePerRow::ProcessArea\(\)](#), and [dng_opcode_ScalePerColumn::ProcessArea\(\)](#).

The documentation for this class was generated from the following files:

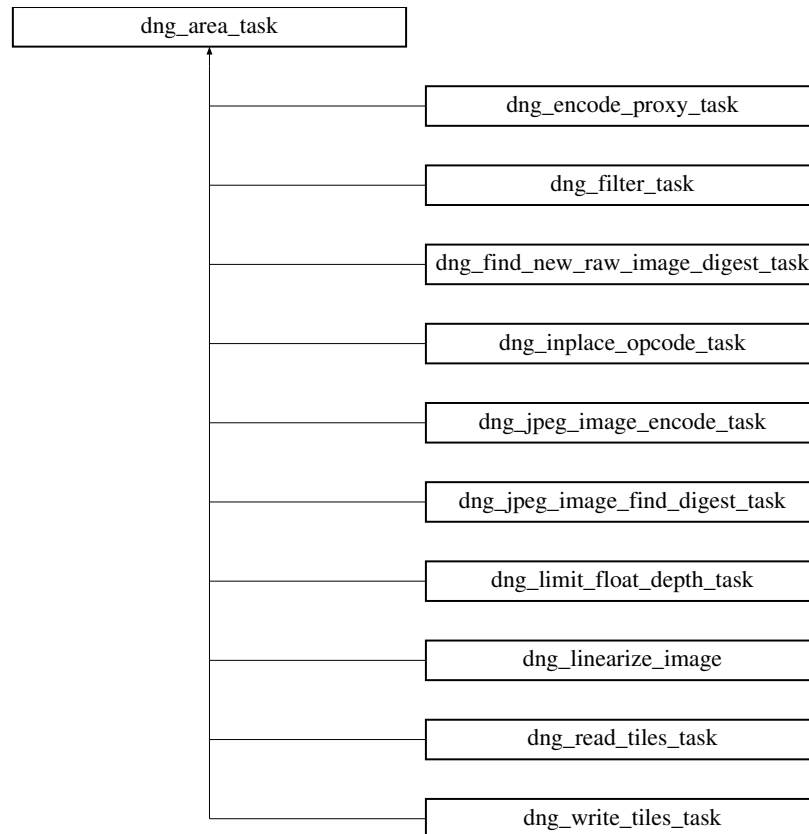

- [dng_misc_opcodes.h](#)
- [dng_misc_opcodes.cpp](#)

6.12 dng_area_task Class Reference

Abstract class for rectangular processing operations with support for partitioning across multiple processing resources and observing memory constraints.

```
#include <dng_area_task.h>
```

Inheritance diagram for dng_area_task:

Public Member Functions

- uint32 **fMinTaskArea**
- [dng_point](#) **fUnitCell**
- [dng_point](#) **fMaxTileSize**

6.12.1 Detailed Description

Abstract class for rectangular processing operations with support for partitioning across multiple processing resources and observing memory constraints.

6.12.2 Member Function Documentation

6.12.2.1 [dng_point](#) [dng_area_task::FindTileSize](#) (const [dng_rect](#) & *area*) const

Find tile size taking into account repeating tiles, unit cell, and maximum tile size.

Parameters

<i>area</i>	Computation area for which to find tile size.
-------------	---

Return values

<i>Tile</i>	size as height and width in point.
-------------	------------------------------------

References [MaxTileSize\(\)](#), [RepeatingTile1\(\)](#), [RepeatingTile2\(\)](#), [RepeatingTile3\(\)](#), and [UnitCell\(\)](#).

Referenced by [Perform\(\)](#).

6.12.2.2 void [dng_area_task::Finish](#) (uint32 *threadCount*) [virtual]

Task computation finalization and teardown method. Called after all resources have completed processing. Can be overridden to accumulate results and free resources allocated in [Start](#).

Parameters

<i>threadCount</i>	Number of threads used for processing. Same as value passed to Start .
--------------------	--

Referenced by [Perform\(\)](#).

6.12.2.3 virtual uint32 [dng_area_task::MaxThreads](#) () const [inline], [virtual]

Getter for the maximum number of threads (resources) that can be used for processing

Return values

<i>Number</i>	of threads, minimum of 1, that can be used for this task.
---------------	---

6.12.2.4 virtual dng_point dng_area_task::MaxTileSize () const [inline],[virtual]

Getter for maximum size of a tile for processing. Often processing will need to allocate temporary buffers or use other resources that are either fixed or in limited supply. The maximum tile size forces further partitioning if the tile is bigger than this size.

Return values

<i>Maximum</i>	tile size allowed for this area task.
----------------	---------------------------------------

Referenced by FindTileSize().

6.12.2.5 virtual uint32 dng_area_task::MinTaskArea () const [inline],[virtual]

Getter for minimum area of a partitioned rectangle. Often it is not profitable to use more resources if it requires partitioning the input into chunks that are too small, as the overhead increases more than the speedup. This method can be overridden for a specific task to indicate the smallest area for partitioning. Default is 256x256 pixels.

Return values

<i>Minimum</i>	area for a partitoned tile in order to give performant operation. (Partitions can be smaller due to small inputs and edge cases.)
----------------	---

6.12.2.6 void dng_area_task::Perform (dng_area_task & task, const dng_rect & area, dng_memory_allocator * allocator, dng_abort_sniffer * sniffer) [static]

Default resource partitioner that assumes a single resource to be used for processing. Implementations that are aware of multiple processing resources should override (replace) this method. This is usually done in [dng_host::PerformAreaTask](#).

Parameters

<i>task</i>	The task to perform.
<i>area</i>	The area on which mage processing should be performed.
<i>allocator</i>	dng_memory_allocator to use for allocating temporary buffers, etc.
<i>sniffer</i>	dng_abort_sniffer to use to check for user cancellation and progress updates.

References FindTileSize(), Finish(), ProcessOnThread(), and Start().

Referenced by dng_host::PerformAreaTask().

6.12.2.7 virtual void dng_area_task::Process (uint32 threadIndex, const dng_rect & tile, dng_abort_sniffer * sniffer) [pure virtual]

Process one tile or fully partitioned area. This method is overridden by derived classes to implement the actual image processing. Note that the sniffer can be ignored if it is certain that a processing task will complete very quickly. This method should never be called directly but rather accessed via Process. There is no allocator parameter as all allocation should be done in Start.

Parameters

<i>threadIndex</i>	0 to threadCount - 1 index indicating which thread this is. (Can be used to get a thread-specific buffer allocated in the Start method.)
<i>tile</i>	Area to process.
<i>sniffer</i>	dng_abort_sniffer to use to check for user cancellation and progress updates.

Implemented in [dng_write_tiles_task](#), [dng_encode_proxy_task](#), [dng_read_tiles_task](#), [dng_find_new_raw_image_digest_task](#), [dng_linearize_image](#), [dng_inplace_opcode_task](#), [dng_limit_float_depth_task](#), [dng_jpeg_image_find_digest_task](#), [dng_filter_task](#), and [dng_jpeg_image_encode_task](#).

Referenced by `ProcessOnThread()`.

6.12.2.8 `void dng_area_task::ProcessOnThread (uint32 threadIndex, const dng_rect & area, const dng_point & tileSize, dng_abort_sniffer * sniffer)`

Handle one resource's worth of partitioned tiles. Called after thread partitioning has already been done. Area may be further subdivided to handle maximum tile size, etc. It will be rare to override this method.

Parameters

<i>threadIndex</i>	0 to threadCount - 1 index indicating which thread this is.
<i>area</i>	Tile area partitioned to this resource.
<i>tileSize</i>	
<i>sniffer</i>	dng_abort_sniffer to use to check for user cancellation and progress updates.

References `Process()`, `RepeatingTile1()`, `RepeatingTile2()`, `RepeatingTile3()`, and `dng_abort_sniffer::SniffForAbort()`.

Referenced by `Perform()`.

6.12.2.9 `dng_rect dng_area_task::RepeatingTile1 () const [virtual]`

Getter for `RepeatingTile1`. `RepeatingTile1`, `RepeatingTile2`, and `RepeatingTile3` are used to establish a set of 0 to 3 tile patterns for which the resulting partitions that the final `Process` method is called on will not cross tile boundaries in any of the tile patterns. This can be used for a processing routine that needs to read from two tiles and write to a third such that all the tiles are aligned and sized in a certain way. A `RepeatingTile` value is valid if it is non-empty. Higher numbered `RepeatingTile` patterns are only used if all lower ones are non-empty. A `RepeatingTile` pattern must be a multiple of `UnitCell` in size for all constraints of the `partitionerr` to be met.

Reimplemented in [dng_encode_proxy_task](#), [dng_linearize_image](#), and [dng_limit_float_depth_task](#).

Referenced by `FindTileSize()`, and `ProcessOnThread()`.

6.12.2.10 `dng_rect dng_area_task::RepeatingTile2 () const [virtual]`

Getter for `RepeatingTile2`. `RepeatingTile1`, `RepeatingTile2`, and `RepeatingTile3` are used to establish a set of 0 to 3 tile patterns for which the resulting partitions that the final `Process` method is called on will not cross tile boundaries in any of the tile patterns. This can be used for a processing routine that needs to read from two tiles and write to a third such that all the tiles are aligned and sized in a certain way. A `RepeatingTile` value is valid if it is non-empty. Higher numbered `RepeatingTile` patterns are only used if all lower ones are non-empty. A `RepeatingTile` pattern must be a multiple of `UnitCell` in size for all constraints of the `partitionerr` to be met.

Reimplemented in [dng_encode_proxy_task](#), [dng_linearize_image](#), and [dng_limit_float_depth_task](#).

Referenced by `FindTileSize()`, and `ProcessOnThread()`.

6.12.2.11 `dng_rect dng_area_task::RepeatingTile3 () const [virtual]`

Getter for `RepeatingTile3`. `RepeatingTile1`, `RepeatingTile2`, and `RepeatingTile3` are used to establish a set of 0 to 3 tile patterns for which the resulting partitions that the final `Process` method is called on will not cross tile boundaries in any of the tile patterns. This can be used for a processing routine that needs to read from two tiles and write to a third such that all the tiles are aligned and sized in a certain way. A `RepeatingTile` value is valid if it is non-empty. Higher numbered `RepeatingTile` patterns are only used if all lower ones are non-empty. A `RepeatingTile` pattern must be a multiple of `UnitCell` in size for all constraints of the `partitionerr` to be met.

Referenced by `FindTileSize()`, and `ProcessOnThread()`.

6.12.2.12 `void dng_area_task::Start (uint32 threadCount, const dng_point & tileSize, dng_memory_allocator * allocator, dng_abort_sniffer * sniffer) [virtual]`

Task startup method called before any processing is done on partitions. The Start method is called before any processing is done and can be overridden to allocate temporary buffers, etc.

Parameters

<i>threadCount</i>	Total number of threads that will be used for processing. Less than or equal to MaxThreads.
<i>tileSize</i>	Size of source tiles which will be processed. (Not all tiles will be this size due to edge conditions.)
<i>allocator</i>	dng_memory_allocator to use for allocating temporary buffers, etc.
<i>sniffer</i>	Sniffer to test for user cancellation and to set up progress.

Reimplemented in [dng_find_new_raw_image_digest_task](#), [dng_render_task](#), [dng_resample_task](#), [dng_inplace_opcode_task](#), [dng_filter_opcode_task](#), and [dng_filter_task](#).

Referenced by Perform().

6.12.2.13 `virtual dng_point dng_area_task::UnitCell () const [inline],[virtual]`

Getter for dimensions of which partitioned tiles should be a multiple. Various methods of processing prefer certain alignments. The partitioning attempts to construct tiles such that the sizes are a multiple of the dimensions of this point.

Return values

<i>a</i>	point giving preferred alignment in x and y
----------	---

Referenced by FindTileSize().

- [dng_area_task.cpp](#)

6.13 dng_bad_pixel_list Class Reference

A list of bad pixels and rectangles (usually single rows or columns).

```
#include <dng_bad_pixels.h>
```

Public Types

- enum { **kNoIndex** = 0xFFFFFFFF }

Public Member Functions

- [dng_bad_pixel_list](#) ()
Create an empty bad pixel list.
- uint32 [PointCount](#) () const
Returns the number of bad single pixels.
- const [dng_point](#) & [Point](#) (uint32 index) const
- uint32 [RectCount](#) () const
Returns the number of bad rectangles.

- const [dng_rect](#) & [Rect](#) (uint32 index) const
- bool [IsEmpty](#) () const
- bool [NotEmpty](#) () const
- void [AddPoint](#) (const [dng_point](#) &pt)
- void [AddRect](#) (const [dng_rect](#) &r)
- void [Sort](#) ()
- bool [IsPointIsolated](#) (uint32 index, uint32 radius) const
- bool [IsRectIsolated](#) (uint32 index, uint32 radius) const
- bool [IsValidPoint](#) (const [dng_point](#) &pt, const [dng_rect](#) &imageBounds, uint32 index=kNoIndex) const

6.13.1 Detailed Description

A list of bad pixels and rectangles (usually single rows or columns).

6.13.2 Member Function Documentation

6.13.2.1 void dng_bad_pixel_list::AddPoint (const [dng_point](#) & *pt*)

Add the specified coordinate to the list of bad single pixels.

Parameters

<i>pt</i>	The bad single pixel to add.
-----------	------------------------------

6.13.2.2 void dng_bad_pixel_list::AddRect (const [dng_rect](#) & *r*)

Add the specified rectangle to the list of bad rectangles.

Parameters

<i>pt</i>	The bad rectangle to add.
-----------	---------------------------

6.13.2.3 bool dng_bad_pixel_list::IsEmpty () const [inline]

Returns true iff there are zero bad single pixels and zero bad rectangles.

References [PointCount\(\)](#), and [RectCount\(\)](#).

Referenced by [NotEmpty\(\)](#).

6.13.2.4 bool dng_bad_pixel_list::IsPointIsolated (uint32 *index*, uint32 *radius*) const

Returns true iff the specified bad single pixel is isolated, i.e., there is no other bad single pixel or bad rectangle that lies within radius pixels of this bad single pixel.

Parameters

<i>index</i>	The index of the bad single pixel to test.
<i>radius</i>	The pixel radius to test for isolation.

References [Point\(\)](#), [PointCount\(\)](#), [Rect\(\)](#), and [RectCount\(\)](#).

Referenced by [dng_opcode_FixBadPixelsList::ProcessArea\(\)](#).

6.13.2.5 `bool dng_bad_pixel_list::IsValid (const dng_point & pt, const dng_rect & imageBounds, uint32 index = kNoIndex) const`

Returns true iff the specified point is valid, i.e., lies within the specified image bounds, is different from all other bad single pixels, and is not contained in any bad rectangle. The second and third conditions are only checked if provided with a starting search index.

Parameters

<i>pt</i>	The point to test for validity.
<i>imageBounds</i>	The pt must lie within imageBounds to be valid. The search index to use (or kNoIndex, to avoid a search) for checking for validity.

References Point(), PointCount(), Rect(), and RectCount().

6.13.2.6 `bool dng_bad_pixel_list::IsRectIsolated (uint32 index, uint32 radius) const`

Returns true iff the specified bad rectangle is isolated, i.e., there is no other bad single pixel or bad rectangle that lies within radius pixels of this bad rectangle.

Parameters

<i>index</i>	The index of the bad rectangle to test.
<i>radius</i>	The pixel radius to test for isolation.

References Rect(), and RectCount().

Referenced by dng_opcode_FixBadPixelsList::ProcessArea().

6.13.2.7 `bool dng_bad_pixel_list::NotEmpty () const [inline]`

Returns true iff there is at least one bad single pixel or at least one bad rectangle.

References IsEmpty().

6.13.2.8 `const dng_point& dng_bad_pixel_list::Point (uint32 index) const [inline]`

Retrieves the bad single pixel coordinate via the specified list index.

Parameters

<i>index</i>	The list index from which to retrieve the bad single pixel coordinate.
--------------	--

Referenced by IsPointIsolated(), IsValid(), IsRectIsolated(), dng_opcode_FixBadPixelsList::ProcessArea(), and dng_opcode_FixBadPixelsList::PutData().

6.13.2.9 `const dng_rect& dng_bad_pixel_list::Rect (uint32 index) const [inline]`

Retrieves the bad rectangle via the specified list index.

Parameters

<i>index</i>	The list index from which to retrieve the bad rectangle coordinates.
--------------	--

Referenced by IsPointIsolated(), IsValid(), IsRectIsolated(), dng_opcode_FixBadPixelsList::ProcessArea(), and dng_opcode_FixBadPixelsList::PutData().

6.13.2.10 void dng_bad_pixel_list::Sort ()

Sort the bad single pixels and bad rectangles by coordinates (top to bottom, then left to right).

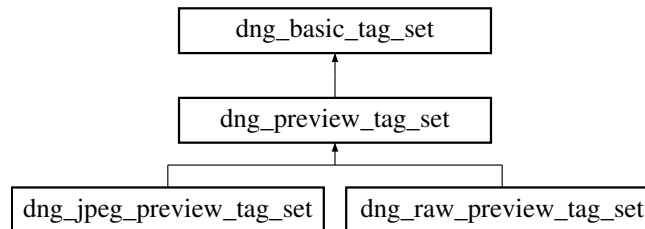

References PointCount(), and RectCount().

Predicate to test if first camera matrix is set.
- bool [HasColorMatrix2](#) () const

Predicate to test if second camera matrix is set.
- const [dng_matrix](#) & [ColorMatrix1](#) () const

Getter for first of up to two color matrices used for calibrations.
- const [dng_matrix](#) & [ColorMatrix2](#) () const

Getter for second of up to two color matrices used for calibrations.
- void [SetForwardMatrix1](#) (const [dng_matrix](#) &m)

Setter for first of up to two forward matrices used for calibrations.
- void [SetForwardMatrix2](#) (const [dng_matrix](#) &m)

Setter for second of up to two forward matrices used for calibrations.
- const [dng_matrix](#) & [ForwardMatrix1](#) () const

Getter for first of up to two forward matrices used for calibrations.
- const [dng_matrix](#) & [ForwardMatrix2](#) () const

Getter for second of up to two forward matrices used for calibrations.
- void [SetReductionMatrix1](#) (const [dng_matrix](#) &m)
- void [SetReductionMatrix2](#) (const [dng_matrix](#) &m)
- const [dng_matrix](#) & [ReductionMatrix1](#) () const

Getter for first of up to two dimensionality reduction hints for four color cameras.
- const [dng_matrix](#) & [ReductionMatrix2](#) () const

Getter for second of up to two dimensionality reduction hints for four color cameras.
- const [dng_fingerprint](#) & [Fingerprint](#) () const

Getter function from profile fingerprint.
- [dng_camera_profile_id](#) [ProfileID](#) () const
- void [SetCopyright](#) (const char *copyright)
- const [dng_string](#) & [Copyright](#) () const
- void [SetEmbedPolicy](#) (uint32 policy)
- uint32 [EmbedPolicy](#) () const
- bool [IsLegalToEmbed](#) () const
- bool [HasHueSatDeltas](#) () const

Returns true iff the profile has a valid HueSatMap color table.
- const [dng_hue_sat_map](#) & [HueSatDeltas1](#) () const

Getter for first HueSatMap color table (for calibration illuminant 1).
- void [SetHueSatDeltas1](#) (const [dng_hue_sat_map](#) &deltas1)

Setter for first HueSatMap color table (for calibration illuminant 1).

- const [dng_hue_sat_map](#) & [HueSatDeltas2](#) () const
Getter for second HueSatMap color table (for calibration illuminant 2).
- void [SetHueSatDeltas2](#) (const [dng_hue_sat_map](#) &deltas2)
Setter for second HueSatMap color table (for calibration illuminant 2).
- uint32 [HueSatMapEncoding](#) () const
Returns the hue sat map encoding (see ProfileHueSatMapEncoding tag).
- void [SetHueSatMapEncoding](#) (uint32 encoding)
- bool [HasLookTable](#) () const
Returns true if the profile has a LookTable.
- const [dng_hue_sat_map](#) & [LookTable](#) () const
Getter for LookTable.
- void [SetLookTable](#) (const [dng_hue_sat_map](#) &table)
Setter for LookTable.
- uint32 [LookTableEncoding](#) () const
Returns the LookTable encoding (see ProfileLookTableEncoding tag).
- void [SetLookTableEncoding](#) (uint32 encoding)
- void [SetBaselineExposureOffset](#) (real64 exposureOffset)
- const [dng_srational](#) & [BaselineExposureOffset](#) () const
- void [SetDefaultBlackRender](#) (uint32 defaultBlackRender)
- uint32 [DefaultBlackRender](#) () const
- const [dng_tone_curve](#) & [ToneCurve](#) () const
Returns the tone curve of the profile.
- void [SetToneCurve](#) (const [dng_tone_curve](#) &curve)
Sets the tone curve of the profile to the specified curve.
- void [SetProfileCalibrationSignature](#) (const char *signature)

- void [SetWasReadFromDNG](#) (bool state=true)
- bool [WasReadFromDNG](#) () const
Was this profile read from a DNG?
- void [SetWasReadFromDisk](#) (bool state=true)
- bool [WasReadFromDisk](#) () const
Was this profile read from disk?
- void [SetWasBuiltinMatrix](#) (bool state=true)
- bool [WasBuiltinMatrix](#) () const
Was this profile a built-in matrix profile?
- bool [IsValid](#) (uint32 channels) const
- bool [EqualData](#) (const [dng_camera_profile](#) &profile) const
- void [Parse](#) ([dng_stream](#) &stream, [dng_camera_profile_info](#) &profileInfo)
Parse profile from dng_camera_profile_info data.
- bool [ParseExtended](#) ([dng_stream](#) &stream)
- virtual void [SetFourColorBayer](#) ()
Convert from a three-color to a four-color Bayer profile.
- [dng_hue_sat_map](#) * [HueSatMapForWhite](#) (const [dng_xy_coord](#) &white) const
- void [Stub](#) ()
Stub out the profile (free memory used by large tables).
- bool [WasStubbed](#) () const
Was this profile stubbed?

Static Public Member Functions

- static void **NormalizeColorMatrix** (dng_matrix &m)
Utility function to normalize the scale of the color matrix.
- static void **NormalizeForwardMatrix** (dng_matrix &m)
Utility function to normalize the scale of the forward matrix.

6.18.1 Detailed Description

Container for DNG camera color profile and calibration data.

6.18.2 Member Function Documentation

6.18.2.1 `const dng_srational& dng_camera_profile::BaselineExposureOffset () const [inline]`

Returns the baseline exposure offset of the profile (see BaselineExposureOffset tag).

Referenced by `dng_negative::TotalBaselineExposure()`.

6.18.2.2 `uint32 dng_camera_profile::CalibrationIlluminant1 () const [inline]`

Getter for first of up to two light sources used for calibration. Uses the EXIF encodings for illuminant and is used to distinguish which matrix to use. Corresponds to the DNG CalibrationIlluminant1 tag.

Referenced by `CalibrationTemperature1()`.

6.18.2.3 `uint32 dng_camera_profile::CalibrationIlluminant2 () const [inline]`

Getter for second of up to two light sources used for calibration. Uses the EXIF encodings for illuminant and is used to distinguish which matrix to use. Corresponds to the DNG CalibrationIlluminant2 tag.

Referenced by `CalibrationTemperature2()`.

6.18.2.4 `real64 dng_camera_profile::CalibrationTemperature1 () const [inline]`

Getter for first of up to two light sources used for calibration, returning result as color temperature.

References `CalibrationIlluminant1()`.

Referenced by `dng_color_spec::dng_color_spec()`, and `HueSatMapForWhite()`.

6.18.2.5 `real64 dng_camera_profile::CalibrationTemperature2 () const [inline]`

Getter for second of up to two light sources used for calibration, returning result as color temperature.

References `CalibrationIlluminant2()`.

Referenced by `dng_color_spec::dng_color_spec()`, and `HueSatMapForWhite()`.

6.18.2.6 `const dng_string& dng_camera_profile::Copyright () const [inline]`

Getter for camera profile copyright.

Return values

<i>Copyright</i>	string for profile.
------------------	---------------------

6.18.2.7 `uint32 dng_camera_profile::DefaultBlackRender () const [inline]`

Returns the default black render of the profile (see DefaultBlackRender tag).

Referenced by `dng_render::dng_render()`.

6.18.2.8 `uint32 dng_camera_profile::EmbedPolicy () const [inline]`

Getter for camera profile embed policy.

Parameters

<i>Policy</i>	for profile.
---------------	--------------

Referenced by IsLegalToEmbed().

6.18.2.9 bool dng_camera_profile::EqualData (const dng_camera_profile & *profile*) const

Predicate to check if two camera profiles are colorwise equal, thus ignores the profile name.

Parameters

<i>profile</i>	Camera profile to compare to.
----------------	-------------------------------

6.18.2.10 dng_hue_sat_map * dng_camera_profile::HueSatMapForWhite (const dng_xy_coord & *white*) const

Find the hue/sat table to use for a given white point, if any. The calling routine owns the resulting table.

References CalibrationTemperature1(), CalibrationTemperature2(), HueSatDeltas1(), HueSatDeltas2(), dng_hue_sat_map::Interpolate(), and dng_hue_sat_map::IsValid().

Referenced by dng_render_task::Start().

6.18.2.11 bool dng_camera_profile::IsLegalToEmbed () const [inline]

Returns true iff the profile is legal to embed in a DNG, per the profile's embed policy.

References EmbedPolicy(), and WasReadFromDNG().

6.18.2.12 bool dng_camera_profile::IsValid (uint32 *channels*) const

Determines if this a valid profile for this number of color channels?

Return values

<i>true</i>	if the profile is valid.
-------------	--------------------------

Referenced by dng_color_spec::dng_color_spec(), dng_info::Parse(), and SetFourColorBayer().

6.18.2.13 const dng_string& dng_camera_profile::Name () const [inline]

Getter for camera profile name.

Return values

<i>Name</i>	of profile.
-------------	-------------

Referenced by ProfileID().

6.18.2.14 bool dng_camera_profile::NameIsEmbedded () const [inline]

Test if this name is embedded.

Return values

<i>true</i>	if the name matches the name of the embedded camera profile.
-------------	--

6.18.2.15 `bool dng_camera_profile::ParseExtended (dng_stream & stream)`

Parse from an extended profile stream, which is similar to stand alone TIFF file.

References Parse().

6.18.2.16 `const dng_string& dng_camera_profile::ProfileCalibrationSignature () const` `[inline]`

Returns the profile calibration signature (see ProfileCalibrationSignature tag) of the profile.

Referenced by dng_color_spec::dng_color_spec().

6.18.2.17 `dng_camera_profile_id dng_camera_profile::ProfileID () const` `[inline]`

Getter for camera profile id.

Return values

<i>ID</i>	of profile.
-----------	-------------

References Fingerprint(), and Name().

6.18.2.18 `void dng_camera_profile::SetBaselineExposureOffset (real64 exposureOffset)` `[inline]`

Sets the baseline exposure offset of the profile (see BaselineExposureOffset tag) to the specified value.

Referenced by Parse().

6.18.2.19 `void dng_camera_profile::SetCalibrationIlluminant1 (uint32 light)` `[inline]`

Setter for first of up to two light sources used for calibration. Uses the EXIF encodings for illuminant and is used to distinguish which matrix to use. Corresponds to the DNG CalibrationIlluminant1 tag.

Referenced by Parse().

6.18.2.20 `void dng_camera_profile::SetCalibrationIlluminant2 (uint32 light)` `[inline]`

Setter for second of up to two light sources used for calibration. Uses the EXIF encodings for illuminant and is used to distinguish which matrix to use. Corresponds to the DNG CalibrationIlluminant2 tag.

Referenced by Parse().

6.18.2.21 `void dng_camera_profile::SetColorMatrix1 (const dng_matrix & m)`

Setter for first of up to two color matrices used for reference camera calibrations. These matrices map XYZ values to camera values. The DNG SDK needs to map colors that direction in order to determine the clipping points for highlight recovery logic based on the white point. If cameras were all three-color, the matrix could be stored as a forward matrix. The inverse matrix is required to support four-color cameras.

References NormalizeColorMatrix().

Referenced by Parse().

6.18.2.22 `void dng_camera_profile::SetColorMatrix2 (const dng_matrix & m)`

Setter for second of up to two color matrices used for reference camera calibrations. These matrices map XYZ values to camera values. The DNG SDK needs to map colors that direction in order to determine the clipping points for highlight recovery logic based on the white point. If cameras were all three-color, the matrix could be stored as a forward matrix. The inverse matrix is required to support four-color cameras.

References NormalizeColorMatrix().

Referenced by Parse().

6.18.2.23 void dng_camera_profile::SetCopyright (const char * *copyright*) [inline]

Setter for camera profile copyright.

Parameters

<i>copyright</i>	Copyright string to use for this camera profile.
------------------	--

Referenced by Parse().

6.18.2.24 void dng_camera_profile::SetDefaultBlackRender (uint32 *defaultBlackRender*) [inline]

Sets the default black render of the profile (see DefaultBlackRender tag) to the specified option.

Referenced by Parse().

6.18.2.25 void dng_camera_profile::SetEmbedPolicy (uint32 *policy*) [inline]

Setter for camera profile embed policy.

Parameters

<i>policy</i>	Policy to use for this camera profile.
---------------	--

Referenced by Parse().

6.18.2.26 void dng_camera_profile::SetHueSatMapEncoding (uint32 *encoding*) [inline]

Sets the hue sat map encoding (see ProfileHueSatMapEncoding tag) to the specified encoding.

Referenced by Parse().

6.18.2.27 void dng_camera_profile::SetLookTableEncoding (uint32 *encoding*) [inline]

Sets the LookTable encoding (see ProfileLookTableEncoding tag) to the specified encoding.

Referenced by Parse().

6.18.2.28 void dng_camera_profile::SetName (const char * *name*) [inline]

Setter for camera profile name.

Parameters

<i>name</i>	Name to use for this camera profile.
-------------	--------------------------------------

Referenced by Parse().

6.18.2.29 void dng_camera_profile::SetProfileCalibrationSignature (const char * *signature*) [inline]

Sets the profile calibration signature (see ProfileCalibrationSignature tag) to the specified string.

Referenced by Parse().

6.18.2.30 void dng_camera_profile::SetReductionMatrix1 (const dng_matrix & m)

Setter for first of up to two dimensionality reduction hints for four-color cameras. This is an optional matrix that maps four components to three. See Appendix 6 of the [DNG 1.1.0 specification](#).

Referenced by Parse().

6.18.2.31 void dng_camera_profile::SetReductionMatrix2 (const dng_matrix & m)

Setter for second of up to two dimensionality reduction hints for four-color cameras. This is an optional matrix that maps four components to three. See Appendix 6 of the [DNG 1.1.0 specification](#).

Referenced by Parse().

6.18.2.32 void dng_camera_profile::SetUniqueCameraModelRestriction (const char * camera) [inline]

Setter for camera unique model name to restrict use of this profile.

Parameters

<i>camera</i>	Camera unique model name designating only camera this profile can be used with. (Empty string for no restriction.)
---------------	--

Referenced by Parse().

6.18.2.33 void dng_camera_profile::SetWasBuiltinMatrix (bool state = true) [inline]

Sets internal flag to indicate this profile was originally a built-in matrix profile.

6.18.2.34 void dng_camera_profile::SetWasReadFromDisk (bool state = true) [inline]

Sets internal flag to indicate this profile was originally read from disk.

6.18.2.35 void dng_camera_profile::SetWasReadFromDNG (bool state = true) [inline]

Sets internal flag to indicate this profile was originally read from a DNG file.

6.18.2.36 const dng_string& dng_camera_profile::UniqueCameraModelRestriction () const [inline]

Getter for camera unique model name to restrict use of this profile.

Return values

<i>Unique</i>	model name of only camera this profile can be used with or empty if no restriction.
---------------	---

The documentation for this class was generated from the following files:

- [dng_camera_profile.h](#)
- [dng_camera_profile.cpp](#)

6.19 dng_camera_profile_id Class Reference

An ID for a camera profile consisting of a name and optional fingerprint.

```
#include <dng_camera_profile.h>
```

Public Member Functions

- [dng_camera_profile_id](#) ()
Construct an invalid camera profile ID (empty name and fingerprint).
- [dng_camera_profile_id](#) (const char *name)
- [dng_camera_profile_id](#) (const [dng_string](#) &name)
- [dng_camera_profile_id](#) (const char *name, const [dng_fingerprint](#) &fingerprint)
- [dng_camera_profile_id](#) (const [dng_string](#) &name, const [dng_fingerprint](#) &fingerprint)

- bool [operator==](#) (const [dng_camera_profile_id](#) &id) const
- bool [operator!=](#) (const [dng_camera_profile_id](#) &id) const
- bool [IsValid](#) () const
Returns true iff the camera profile ID is valid.
- void [Clear](#) ()

6.19.1 Detailed Description

An ID for a camera profile consisting of a name and optional fingerprint.

6.19.2 Constructor & Destructor Documentation

6.19.2.1 [dng_camera_profile_id::dng_camera_profile_id \(const char * name \)](#) `[inline]`

Construct a camera profile ID with the specified name and no fingerprint.

Parameters

<i>name</i>	The name of the camera profile ID.
-------------	------------------------------------

6.19.2.2 [dng_camera_profile_id::dng_camera_profile_id \(const dng_string & name \)](#) `[inline]`

Construct a camera profile ID with the specified name and no fingerprint.

Parameters

<i>name</i>	The name of the camera profile ID.
-------------	------------------------------------

6.19.2.3 [dng_camera_profile_id::dng_camera_profile_id \(const char * name, const dng_fingerprint & fingerprint \)](#) `[inline]`

Construct a camera profile ID with the specified name and fingerprint.

Parameters

<i>name</i>	The name of the camera profile ID.
<i>fingerprint</i>	The fingerprint of the camera profile ID.

References [DNG_ASSERT](#), and [dng_fingerprint::IsValid\(\)](#).

6.19.2.4 `dng_camera_profile_id::dng_camera_profile_id (const dng_string & name, const dng_fingerprint & fingerprint)`
`[inline]`

Construct a camera profile ID with the specified name and fingerprint.

Parameters

<i>name</i>	The name of the camera profile ID.
<i>fingerprint</i>	The fingerprint of the camera profile ID.

References DNG_ASSERT, and dng_fingerprint::IsValid().

6.19.3 Member Function Documentation

6.19.3.1 `void dng_camera_profile_id::Clear ()` `[inline]`

Resets the name and fingerprint, thereby making this camera profile ID invalid.

References dng_camera_profile_id().

6.19.3.2 `const dng_fingerprint& dng_camera_profile_id::Fingerprint () const` `[inline]`

Getter for the fingerprint of the camera profile ID.

Return values

<i>The</i>	fingerprint of the camera profile ID.
------------	---------------------------------------

6.19.3.3 `const dng_string& dng_camera_profile_id::Name () const` `[inline]`

Getter for the name of the camera profile ID.

Return values

<i>The</i>	name of the camera profile ID.
------------	--------------------------------

6.19.3.4 `bool dng_camera_profile_id::operator!= (const dng_camera_profile_id & id) const` `[inline]`

Test for inequality of two camera profile IDs.

Parameters

<i>The</i>	id of the camera profile ID to compare.
------------	---

6.19.3.5 `bool dng_camera_profile_id::operator== (const dng_camera_profile_id & id) const` `[inline]`

Test for equality of two camera profile IDs.

Parameters

<i>The</i>	id of the camera profile ID to compare.
------------	---

6.21.1 Detailed Description

An abstract color space.

6.21.2 Member Function Documentation

6.21.2.1 `real64 dng_color_space::GammaDecode (real64 y) const` `[inline]`

Map an input value through this color space's decoding gamma (inverse of the encoding gamma).

References [dng_1d_function::EvaluateInverse\(\)](#), and [GammaFunction\(\)](#).

6.21.2.2 `bool dng_color_space::ICCProfile (uint32 & size, const uint8 *& data) const` [virtual]

Getter for ICC profile, if this color space has one.

Parameters

<i>size</i>	Out parameter which receives size on return.
<i>data</i>	Receives bytes of profile.

Return values

<i>Returns</i>	true if this color space has an ICC profile, false otherwise.
----------------	---

Reimplemented in [dng_space_GrayGamma22](#), [dng_space_GrayGamma18](#), [dng_space_ProPhoto](#), [dng_space_Color-Match](#), [dng_space_AdobeRGB](#), and [dng_space_sRGB](#).

6.21.2.3 `bool dng_color_space::IsMonochrome () const` [inline]

Predicate which is true if this color space is monochrome (has only a single column).

Referenced by `dng_renderer::Render()`.

6.21.2.4 `const dng_matrix& dng_color_space::MatrixFromPCS () const` [inline]

Return a matrix which transforms Profile Connection Space data into this color space.

Referenced by `dng_render_task::Start()`.

6.21.2.5 `const dng_matrix& dng_color_space::MatrixToPCS () const` [inline]

Return a matrix which transforms source data in this color space into the Profile Connection Space.

Referenced by `dng_render_task::Start()`.

The documentation for this class was generated from the following files:

6.22.1 Detailed Description

Color transform taking into account white point and camera calibration and individual calibration from DNG negative.

6.22.2 Constructor & Destructor Documentation

6.22.2.1 dng_color_spec::dng_color_spec (const dng_negative & *negative*, const dng_camera_profile * *profile*)

Read calibration info from DNG negative and construct a [dng_color_spec](#).

References [dng_negative::AnalogBalance\(\)](#), [dng_camera_profile::CalibrationTemperature1\(\)](#), [dng_camera_profile::CalibrationTemperature2\(\)](#), [dng_negative::CameraCalibration1\(\)](#), [dng_negative::CameraCalibration2\(\)](#), [dng_camera_profile::ColorMatrix1\(\)](#), [dng_camera_profile::ColorMatrix2\(\)](#), [dng_camera_profile::ForwardMatrix1\(\)](#), [dng_camera_profile::ForwardMatrix2\(\)](#), [dng_camera_profile::HasColorMatrix2\(\)](#), [dng_camera_profile::IsValid\(\)](#), [dng_camera_profile::NormalizeForwardMatrix\(\)](#), [dng_camera_profile::ProfileCalibrationSignature\(\)](#), [dng_camera_profile::ReductionMatrix1\(\)](#), [dng_camera_profile::ReductionMatrix2\(\)](#), [ThrowBadFormat\(\)](#), [ThrowProgramError\(\)](#), and [dng_camera_profile::WasStubbed\(\)](#).

6.22.3 Member Function Documentation

6.22.3.1 const dng_matrix & dng_color_spec::CameraToPCS () const

Getter for camera to Profile Connection Space color transform.

Return values

A	transform that takes into account all camera calibration transforms and white point.
---	--

References [DNG_ASSERT](#).

6.22.3.2 const dng_vector & dng_color_spec::CameraWhite () const

Return white point in camera native color coordinates.

Return values

A	dng_vector with components ranging from 0.0 to 1.0 that is normalized such that one component is equal to 1.0 .
---	---

References [DNG_ASSERT](#).

6.22.3.3 uint32 dng_color_spec::Channels () const [inline]

Number of channels used for this color transform. Three for most cameras.

6.22.3.4 dng_xy_coord dng_color_spec::NeutralToXY (const dng_vector & *neutral*)

Return the XY value to use for SetWhiteXY for a given camera color space coordinate as the white point.

Parameters

<i>neutral</i>	A camera color space value to use for white point. Components range from 0.0 to 1.0 and should be normalized such that the largest value is 1.0 .
----------------	---

Return values

<i>White</i>	point in XY space that makes neutral map to this XY value as closely as possible.
--------------	---

6.22.3.5 const dng_matrix & dng_color_spec::PCStoCamera () const

Getter for Profile Connection Space to camera color transform.

Return values

<i>A</i>	transform that takes into account all camera calibration transforms and white point.
----------	--

References DNG_ASSERT.

6.22.3.6 void dng_color_spec::SetWhiteXY (const dng_xy_coord & white)

Setter for white point. Value is as XY colorspace coordinate.

Parameters

<i>white</i>	White point to set as an XY value.
--------------	------------------------------------

6.22.3.7 const dng_xy_coord & dng_color_spec::WhiteXY () const

Getter for white point. Value is as XY colorspace coordinate.

Return values

<i>XY</i>	value of white point.
-----------	-----------------------

References DNG_ASSERT.

- [dng_color_spec.h](#)
- [dng_color_spec.cpp](#)

6.23 dng_const_tile_buffer Class Reference

Class to get resource acquisition is instantiation behavior for constant (read-only) tile buffers.

```
#include <dng_image.h>
```

Inheritance diagram for dng_const_tile_buffer:

Public Member Functions

- [dng_const_tile_buffer](#) (const [dng_image](#) &image, const [dng_rect](#) &tile)

Additional Inherited Members

6.23.1 Detailed Description

Class to get resource acquisition is instantiation behavior for constant (read-only) tile buffers.

6.23.2 Constructor & Destructor Documentation

6.23.2.1 dng_const_tile_buffer::dng_const_tile_buffer (const [dng_image](#) & *image*, const [dng_rect](#) & *tile*)

Obtain a read-only tile from an image.

Parameters

<i>image</i>	Image tile will come from.
<i>tile</i>	Rectangle denoting extent of tile.

The documentation for this class was generated from the following files:

- [dng_image.h](#)
- [dng_image.cpp](#)

6.24 dng_date_time Class Reference

Class for holding a date/time and converting to and from relevant date/time formats.

```
#include <dng_date_time.h>
```

Public Member Functions

- [dng_date_time](#) ()
Construct an invalid date/time.
- [dng_date_time](#) (uint32 year, uint32 month, uint32 day, uint32 hour, uint32 minute, uint32 second)
- bool [IsValid](#) () const
- bool [NotValid](#) () const
- bool [operator==](#) (const [dng_date_time](#) &dt) const
Equal operator.
- bool [operator!=](#) (const [dng_date_time](#) &dt) const
- void [Clear](#) ()
Set date to an invalid value.
- bool [Parse](#) (const char *s)

Public Attributes

- uint32 **fYear**
- uint32 **fMonth**

- uint32 **fDay**
- uint32 **fHour**
- uint32 **fMinute**
- uint32 **fSecond**

6.24.1 Detailed Description

Class for holding a date/time and converting to and from relevant date/time formats.

6.24.2 Constructor & Destructor Documentation

6.24.2.1 dng_date_time::dng_date_time (uint32 year, uint32 month, uint32 day, uint32 hour, uint32 minute, uint32 second)

Construct a date/time with specific values.

Parameters

<i>year</i>	Year to use as actual integer value, such as 2006.
<i>month</i>	Month to use from 1 - 12, where 1 is January.
<i>day</i>	Day of month to use from 1 -31, where 1 is the first.
<i>hour</i>	Hour of day to use from 0 - 23, where 0 is midnight.
<i>minute</i>	Minute of hour to use from 0 - 59.
<i>second</i>	Second of minute to use from 0 - 59.

6.24.3 Member Function Documentation

6.24.3.1 bool dng_date_time::IsValid () const

Predicate to determine if a date is valid.

Return values

<i>true</i>	if all fields are within range.
-------------	---------------------------------

Referenced by LocalTimeZone(), NotValid(), and Parse().

6.24.3.2 bool dng_date_time::NotValid () const [inline]

Predicate to determine if a date is invalid.

Return values

<i>true</i>	if any field is out of range.
-------------	-------------------------------

References IsValid().

6.24.3.3 bool dng_date_time::Parse (const char * s)

Parse an EXIF format date string.

Parameters

<i>s</i>	Input date string to parse.
----------	-----------------------------

Return values

<i>true</i>	if date was parsed successfully and date is valid.
-------------	--

References IsValid().

The documentation for this class was generated from the following files:

- [dng_date_time.h](#)
- [dng_date_time.cpp](#)

6.25 dng_date_time_info Class Reference

Class for holding complete data/time/zone information.

```
#include <dng_date_time.h>
```

Public Member Functions

- bool **IsValid** () const
- bool **NotValid** () const
- void **Clear** ()
- const [dng_date_time](#) & **DateTime** () const
- void **SetDateTime** (const [dng_date_time](#) &dt)
- const [dng_string](#) & **Subseconds** () const
- void **SetSubseconds** (const [dng_string](#) &s)
- const [dng_time_zone](#) & **TimeZone** () const
- void **SetZone** (const [dng_time_zone](#) &zone)
- void **Decode_ISO_8601** (const char *s)
- [dng_string](#) **Encode_ISO_8601** () const
- void **Decode_IPTC_Date** (const char *s)
- [dng_string](#) **Encode_IPTC_Date** () const
- void **Decode_IPTC_Time** (const char *s)
- [dng_string](#) **Encode_IPTC_Time** () const

6.25.1 Detailed Description

Class for holding complete data/time/zone information.

The documentation for this class was generated from the following files:

- [dng_date_time.h](#)
- [dng_date_time.cpp](#)

6.26 dng_date_time_storage_info Class Reference

Store file offset from which date was read.

```
#include <dng_date_time.h>
```

Public Member Functions

- [dng_date_time_storage_info](#) ()
The default constructor initializes to an invalid state.
- [dng_date_time_storage_info](#) (uint64 offset, [dng_date_time_format](#) format)
Construct with file offset and date format.
- bool [IsValid](#) () const
- uint64 [Offset](#) () const
- [dng_date_time_format](#) [Format](#) () const

6.26.1 Detailed Description

Store file offset from which date was read.

Used internally by Adobe to update date in original file.

Warning

Use at your own risk.

6.26.2 Member Function Documentation

6.26.2.1 [dng_date_time_format](#) [dng_date_time_storage_info::Format](#) () const

Get for format date was originally stored in file. Throws a [dng_error_unknown](#) exception if offset is invalid.

Exceptions

dng_exception	with <code>fErrorCode</code> equal to <code>dng_error_unknown</code> if offset is not valid.
-------------------------------	--

References [IsValid\(\)](#), and [ThrowProgramError\(\)](#).

6.26.2.2 bool [dng_date_time_storage_info::IsValid](#) () const

Predicate to determine if an offset is valid.

Return values

true	if offset is valid.
----------------------	---------------------

Referenced by [Format\(\)](#), and [Offset\(\)](#).

6.26.2.3 uint64 [dng_date_time_storage_info::Offset](#) () const

Getter for offset in file.

Exceptions

dng_exception	with <code>fErrorCode</code> equal to <code>dng_error_unknown</code> if offset is not valid.
-------------------------------	--

References [IsValid\(\)](#), and [ThrowProgramError\(\)](#).

The documentation for this class was generated from the following files:

6.27 dng_dirty_tile_buffer Class Reference

Class to get resource acquisition is instantiation behavior for dirty (writable) tile buffers.

```
#include <dng_image.h>
```

Inheritance diagram for dng_dirty_tile_buffer:

Public Member Functions

- [dng_dirty_tile_buffer](#) ([dng_image](#) &image, const [dng_rect](#) &tile)

Additional Inherited Members

6.27.1 Detailed Description

Class to get resource acquisition is instantiation behavior for dirty (writable) tile buffers.

6.27.2 Constructor & Destructor Documentation

6.27.2.1 dng_dirty_tile_buffer::dng_dirty_tile_buffer ([dng_image](#) & *image*, const [dng_rect](#) & *tile*)

Obtain a writable tile from an image.

Parameters

<i>image</i>	Image tile will come from.
<i>tile</i>	Rectangle denoting extent of tile.

The documentation for this class was generated from the following files:

- [dng_image.h](#)
- [dng_image.cpp](#)

6.28 dng_dither Class Reference

Public Member Functions

- const uint16 * **NoiseBuffer16** () const

Static Public Member Functions

- static const [dng_dither](#) & **Get** ()

Static Public Attributes

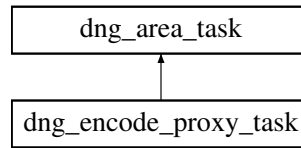

- static const uint32 **kRNGBits** = 7
- static const uint32 **kRNGSize** = 1 << kRNGBits
- static const uint32 **kRNGMask** = kRNGSize - 1
- static const uint32 **kRNGSize2D** = kRNGSize * kRNGSize

- [dng_utils.cpp](#)

6.29 dng_encode_proxy_task Class Reference

Inheritance diagram for `dng_encode_proxy_task`:

Public Member Functions

- **dng_encode_proxy_task** ([dng_host](#) &host, const [dng_image](#) &srcImage, [dng_image](#) &dstImage, const real64 *black, const real64 *white, bool isSceneReferred)
- virtual [dng_rect RepeatingTile1](#) () const
- virtual [dng_rect RepeatingTile2](#) () const
- virtual void [Process](#) (uint32 threadIndex, const [dng_rect](#) &tile, [dng_abort_sniffer](#) *sniffer)

Additional Inherited Members

6.29.1 Member Function Documentation

6.29.1.1 void `dng_encode_proxy_task::Process` (uint32 *threadIndex*, const `dng_rect` & *tile*, `dng_abort_sniffer` * *sniffer*)
[virtual]

Process one tile or fully partitioned area. This method is overridden by derived classes to implement the actual image processing. Note that the sniffer can be ignored if it is certain that a processing task will complete very quickly. This method should never be called directly but rather accessed via `Process`. There is no allocator parameter as all allocation should be done in `Start`.

Parameters

<i>threadIndex</i>	0 to threadCount - 1 index indicating which thread this is. (Can be used to get a thread-specific buffer allocated in the <code>Start</code> method.)
<i>tile</i>	Area to process.
<i>sniffer</i>	dng_abort_sniffer to use to check for user cancellation and progress updates.

Implements [dng_area_task](#).

References [dng_memory_block::Buffer_uint16\(\)](#), [dng_pixel_buffer::ConstPixel_uint16\(\)](#), [dng_pixel_buffer::DirtyPixel_uint8\(\)](#), and [dng_image::Planes\(\)](#).

6.29.1.2 virtual `dng_rect dng_encode_proxy_task::RepeatingTile1 () const` `[inline]`, `[virtual]`

Getter for RepeatingTile1. RepeatingTile1, RepeatingTile2, and RepeatingTile3 are used to establish a set of 0 to 3 tile patterns for which the resulting partitions that the final Process method is called on will not cross tile boundaries in any of the tile patterns. This can be used for a processing routine that needs to read from two tiles and write to a third such that all the tiles are aligned and sized in a certain way. A RepeatingTile value is valid if it is non-empty. Higher numbered RepeatingTile patterns are only used if all lower ones are non-empty. A RepeatingTile pattern must be a multiple of UnitCell in size for all constraints of the partitionerr to be met.

Reimplemented from [dng_area_task](#).

References [dng_image::RepeatingTile\(\)](#).

6.29.1.3 virtual `dng_rect dng_encode_proxy_task::RepeatingTile2 () const` `[inline]`, `[virtual]`

Getter for RepeatingTile2. RepeatingTile1, RepeatingTile2, and RepeatingTile3 are used to establish a set of 0 to 3 tile patterns for which the resulting partitions that the final Process method is called on will not cross tile boundaries in any of the tile patterns. This can be used for a processing routine that needs to read from two tiles and write to a third such that all the tiles are aligned and sized in a certain way. A RepeatingTile value is valid if it is non-empty. Higher numbered RepeatingTile patterns are only used if all lower ones are non-empty. A RepeatingTile pattern must be a multiple of UnitCell in size for all constraints of the partitionerr to be met.

Reimplemented from [dng_area_task](#).

References [dng_image::RepeatingTile\(\)](#).

6.30 dng_exception Class Reference

All exceptions thrown by the DNG SDK use this exception class.

```
#include <dng_exceptions.h>
```

Public Member Functions

- [dng_exception](#) ([dng_error_code](#) code)
- [dng_error_code](#) [ErrorCode](#) () const

6.30.1 Detailed Description

All exceptions thrown by the DNG SDK use this exception class.

6.30.2 Constructor & Destructor Documentation

6.30.2.1 `dng_exception::dng_exception (dng_error_code code)` `[inline]`

Construct an exception representing the given error code.

Parameters

<i>code</i>	Error code this exception is for.
-------------	-----------------------------------

6.30.3 Member Function Documentation

6.30.3.1 `dng_error_code dng_exception::ErrorCode () const` `[inline]`

Getter for error code of this exception

Return values

<i>The</i>	error code of this exception.
------------	-------------------------------

The documentation for this class was generated from the following file:

- [dng_exceptions.h](#)

6.31 dng_exif Class Reference

Container class for parsing and holding EXIF tags.

```
#include <dng_exif.h>
```

Public Member Functions

- virtual `dng_exif * Clone () const`
Make clone.
- void `SetEmpty ()`
Clear all EXIF fields.
- void `CopyGPSFrom (const dng_exif &exif)`
- void `SetExposureTime (real64 et, bool snap=true)`
- void `SetShutterSpeedValue (real64 ss)`
- void `SetFNumber (real64 fs)`
- void `SetApertureValue (real64 av)`
- void `UpdateDateTime (const dng_date_time_info &dt)`
- bool `AtLeastVersion0230 () const`
Returns true iff the EXIF version is at least 2.3.
- virtual bool `ParseTag (dng_stream &stream, dng_shared &shared, uint32 parentCode, bool isMainIFD, uint32 tagCode, uint32 tagType, uint32 tagCount, uint64 tagOffset)`
- virtual void `PostParse (dng_host &host, dng_shared &shared)`

6.31.1 Detailed Description

Container class for parsing and holding EXIF tags.

Public member fields are documented in [EXIF specification](#).

6.31.2 Member Function Documentation

6.31.2.1 `real64 dng_exif::ApertureValueToFNumber(real64 av) [static]`

Utility to convert aperture value (APEX units) to f-number.

Parameters

<code>av</code>	The aperture value (APEX units) to convert.
-----------------	---

Referenced by `ApertureValueToFNumber()`, and `SetApertureValue()`.

6.31.2.2 `real64 dng_exif::ApertureValueToFNumber (const dng_urational & av) [static]`

Utility to convert aperture value (APEX units) to f-number.

Parameters

<i>av</i>	The aperture value (APEX units) to convert.
-----------	---

References `ApertureValueToFNumber()`.

6.31.2.3 `void dng_exif::CopyGPSFrom (const dng_exif & exif)`

Copy all GPS-related fields.

Parameters

<i>exif</i>	Source object from which to copy GPS fields.
-------------	--

Referenced by `dng_image_writer::CleanUpMetadata()`.

6.31.2.4 `dng_urational dng_exif::EncodeFNumber (real64 fs) [static]`

Utility to encode f-number as a rational.

Parameters

<i>fs</i>	The f-number to encode.
-----------	-------------------------

Referenced by `SetFNumber()`.

6.31.2.5 `real64 dng_exif::FNumberToApertureValue (real64 fNumber) [static]`

Utility to convert f-number to aperture value (APEX units).

Parameters

<i>fNumber</i>	The f-number to convert.
----------------	--------------------------

Referenced by `FNumberToApertureValue()`, and `SetFNumber()`.

6.31.2.6 `real64 dng_exif::FNumberToApertureValue (const dng_urational & fNumber) [static]`

Utility to convert f-number to aperture value (APEX units).

Parameters

<i>fNumber</i>	The f-number to convert.
----------------	--------------------------

References `FNumberToApertureValue()`.

6.31.2.7 `void dng_exif::SetApertureValue (real64 av)`

Set the `FNumber` and `ApertureValue` fields.

Parameters

<i>av</i>	The aperture value (APEX units).
-----------	----------------------------------

References ApertureValueToFNumber(), and SetFNumber().

6.31.2.8 void dng_exif::SetExposureTime (real64 *et*, bool *snap* = true)

Set exposure time and shutter speed fields. Optionally fix up common errors and rounding issues with EXIF exposure times.

Parameters

<i>et</i>	Exposure time in seconds.
<i>snap</i>	Set to true to fix up common errors and rounding issues with EXIF exposure times.

References SnapExposureTime().

Referenced by SetShutterSpeedValue().

6.31.2.9 void dng_exif::SetFNumber (real64 *fs*)

Set the FNumber and ApertureValue fields.

Parameters

<i>fs</i>	The f-number to set.
-----------	----------------------

References EncodeFNumber(), and FNumberToApertureValue().

Referenced by SetApertureValue().

6.31.2.10 void dng_exif::SetShutterSpeedValue (real64 *ss*)

Set shutter speed value (APEX units) and exposure time.

Parameters

<i>Shutter</i>	speed in APEX units.
----------------	----------------------

References SetExposureTime().

6.31.2.11 real64 dng_exif::SnapExposureTime (real64 *et*) [static]

Utility to fix up common errors and rounding issues with EXIF exposure times.

Referenced by SetExposureTime().

6.31.2.12 void dng_exif::UpdateDateTime (const dng_date_time_info & *dt*)

Set the DateTime field.

Parameters

<i>dt</i>	The DateTime value.
-----------	---------------------

6.32.1 Member Function Documentation

6.32.1.1 void [dng_fast_interpolator::ProcessArea](#) (uint32 *threadIndex*, [dng_pixel_buffer](#) & *srcBuffer*, [dng_pixel_buffer](#) & *dstBuffer*) [virtual]

Implements filtering operation from one buffer to another. Source and destination pixels are set up in member fields of this class. Ideally, no allocation should be done in this routine.

Parameters

<i>threadIndex</i>	The thread on which this routine is being called, between 0 and threadCount - 1 for the thread-Count passed to Start method.
<i>srcBuffer</i>	Input area and source pixels.
<i>dstBuffer</i>	Output area and destination pixels.

Implements [dng_filter_task](#).

References [dng_pixel_buffer::ConstPixel_uint16\(\)](#), [dng_pixel_buffer::DirtyPixel_uint16\(\)](#), [dng_mosaic_info::fCFA-PatternSize](#), [dng_mosaic_info::fColorPlanes](#), and [kMaxColorPlanes](#).

6.32.1.2 [dng_rect](#) [dng_fast_interpolator::SrcArea](#) (const [dng_rect](#) & *dstArea*) [virtual]

Compute the source area needed for a given destination area. Default implementation assumes destination area is equal to source area for all cases.

Parameters

<i>dstArea</i>	Area to for which pixels will be computed.
----------------	--

Return values

<i>The</i>	source area needed as input to calculate the requested destination area.
------------	--

Reimplemented from [dng_filter_task](#).

The documentation for this class was generated from the following file:

- virtual void **DoWrite** (const void *data, uint32 count, uint64 offset)

Additional Inherited Members

6.33.1 Detailed Description

A stream to/from a disk file. See [dng_stream](#) for read/write interface.

6.33.2 Constructor & Destructor Documentation

6.33.2.1 `dng_file_stream::dng_file_stream (const char * filename, bool output = false, uint32 bufferSize = kDefaultBufferSize)`

Open a stream on a file.

Parameters

<i>filename</i>	Pathname in platform syntax.
<i>output</i>	Set to true if writing, false otherwise.
<i>bufferSize</i>	size of internal buffer to use. Defaults to 4k.

References `ThrowOpenFile()`, and `ThrowSilentError()`.

6.34 dng_filter_opcode Class Reference

Class to represent a filter opcode, such as a convolution.

```
#include <dng_opcodes.h>
```

Inheritance diagram for `dng_filter_opcode`:

Public Member Functions

- virtual `uint32 BufferPixelType` (`uint32 imagePixelType`)
The pixel data type of this opcode.
- virtual `dng_rect ModifiedBounds` (`const dng_rect &imageBounds`)
- virtual `dng_point SrcRepeat` ()
Returns the width and height (in pixels) of the repeating mosaic pattern.
- virtual `dng_rect SrcArea` (`const dng_rect &dstArea`, `const dng_rect &`)
- virtual `dng_point SrcTileSize` (`const dng_point &dstTileSize`, `const dng_rect &imageBounds`)
- virtual void `Prepare` (`dng_negative &`, `uint32`, `const dng_point &`, `const dng_rect &`, `uint32`, `uint32`, `dng_memory_allocator &`)
- virtual void `ProcessArea` (`dng_negative &negative`, `uint32 threadIndex`, `dng_pixel_buffer &srcBuffer`, `dng_pixel_buffer &dstBuffer`, `const dng_rect &dstArea`, `const dng_rect &imageBounds`)=0
- virtual void `Apply` (`dng_host &host`, `dng_negative &negative`, `AutoPtr< dng_image > &image`)
Apply this opcode to the specified image with associated negative.

Protected Member Functions

- `dng_filter_opcode` (`uint32 opcodeID`, `uint32 minVersion`, `uint32 flags`)
- `dng_filter_opcode` (`uint32 opcodeID`, `dng_stream &stream`, `const char *name`)

Additional Inherited Members

6.34.1 Detailed Description

Class to represent a filter opcode, such as a convolution.

6.34.2 Member Function Documentation

6.34.2.1 virtual **dng_rect** dng_filter_opcode::ModifiedBounds (const **dng_rect** & *imageBounds*) [inline],[virtual]

The adjusted bounds (processing area) of this opcode. It is limited to the intersection of the specified image area and the GainMap area.

Referenced by Apply().

6.34.2.2 virtual void dng_filter_opcode::Prepare (**dng_negative** & , uint32 , const **dng_point** & , const **dng_rect** & , uint32 , uint32 , **dng_memory_allocator** &) [inline],[virtual]

Startup method called before any processing is performed on pixel areas. It can be used to allocate (per-thread) memory and setup tasks.

Parameters

<i>negative</i>	The negative object to be processed.
<i>threadCount</i>	The number of threads to be used to perform the processing.
<i>threadCount</i>	Total number of threads that will be used for processing. Less than or equal to MaxThreads.
<i>tileSize</i>	Size of source tiles which will be processed. (Not all tiles will be this size due to edge conditions.)
<i>imageBounds</i>	Total size of image to be processed.
<i>imagePlanes</i>	Number of planes in the image. Less than or equal to kMaxColorPlanes.
<i>bufferPixelFormat</i>	Pixel type of image buffer (see dng_tag_types.h).
<i>allocator</i>	dng_memory_allocator to use for allocating temporary buffers, etc.

Reimplemented in [dng_opcode_FixBadPixelsList](#), and [dng_opcode_FixBadPixelsConstant](#).

Referenced by dng_filter_opcode_task::Start().

6.34.2.3 virtual void dng_filter_opcode::ProcessArea (**dng_negative** & *negative*, uint32 *threadIndex*, **dng_pixel_buffer** & *srcBuffer*, **dng_pixel_buffer** & *dstBuffer*, const **dng_rect** & *dstArea*, const **dng_rect** & *imageBounds*) [pure virtual]

Implements filtering operation from one buffer to another. Source and destination pixels are set up in member fields of this class. Ideally, no allocation should be done in this routine.

Parameters

<i>negative</i>	The negative associated with the pixels to be processed.
<i>threadIndex</i>	The thread on which this routine is being called, between 0 and threadCount - 1 for the threadCount passed to Prepare method.
<i>srcBuffer</i>	Input area and source pixels.
<i>dstBuffer</i>	Destination pixels.
<i>dstArea</i>	Destination pixel processing area.
<i>imageBounds</i>	Total image area to be processed; dstArea will always lie within these bounds.

Implemented in [dng_opcode_FixBadPixelsList](#), and [dng_opcode_FixBadPixelsConstant](#).

Referenced by dng_filter_opcode_task::ProcessArea().

6.34.2.4 `virtual dng_rect dng_filter_opcode::SrcArea (const dng_rect & dstArea, const dng_rect &) [inline], [virtual]`

Returns the source pixel area needed to process a destination pixel area that lies within the specified bounds.

Parameters

<i>dstArea</i>	The destination pixel area to be computed.
<i>imageBounds</i>	The overall image area (dstArea will lie within these bounds).

Return values

<i>The</i>	source pixel area needed to process the specified dstArea.
------------	--

Reimplemented in [dng_opcode_FixBadPixelsList](#), and [dng_opcode_FixBadPixelsConstant](#).

Referenced by `dng_filter_opcode_task::SrcArea()`, and `SrcTileSize()`.

6.34.2.5 `virtual dng_point dng_filter_opcode::SrcTileSize (const dng_point & dstTileSize, const dng_rect & imageBounds) [inline], [virtual]`

Given a destination tile size, calculate input tile size. Similar to `SrcArea`, and should seldom be overridden.

Parameters

<i>dstTileSize</i>	The destination tile size that is targeted for output.
<i>imageBounds</i>	The image bounds (the destination tile will always lie within these bounds).

Return values

<i>The</i>	source tile size needed to compute a tile of the destination size.
------------	--

References `SrcArea()`.

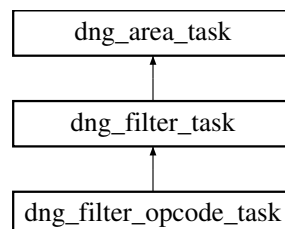

Referenced by `dng_filter_opcode_task::SrcTileSize()`.

The documentation for this class was generated from the following files:

6.35.1.1 virtual void [dng_filter_opcode_task::ProcessArea](#) (uint32 *threadIndex*, [dng_pixel_buffer](#) & *srcBuffer*, [dng_pixel_buffer](#) & *dstBuffer*) [inline], [virtual]

Implements filtering operation from one buffer to another. Source and destination pixels are set up in member fields of this class. Ideally, no allocation should be done in this routine.

Parameters

<i>threadIndex</i>	The thread on which this routine is being called, between 0 and threadCount - 1 for the threadCount passed to Start method.
<i>srcBuffer</i>	Input area and source pixels.
<i>dstBuffer</i>	Output area and destination pixels.

Implements [dng_filter_task](#).

References [dng_pixel_buffer::Area\(\)](#), [dng_image::Bounds\(\)](#), and [dng_filter_opcode::ProcessArea\(\)](#).

6.35.1.2 virtual [dng_rect](#) [dng_filter_opcode_task::SrcArea](#) (const [dng_rect](#) & *dstArea*) [inline], [virtual]

Compute the source area needed for a given destination area. Default implementation assumes destination area is equal to source area for all cases.

Parameters

<i>dstArea</i>	Area to for which pixels will be computed.
----------------	--

Return values

<i>The</i>	source area needed as input to calculate the requested destination area.
------------	--

Reimplemented from [dng_filter_task](#).

References [dng_image::Bounds\(\)](#), and [dng_filter_opcode::SrcArea\(\)](#).

6.35.1.3 virtual [dng_point](#) [dng_filter_opcode_task::SrcTileSize](#) (const [dng_point](#) & *dstTileSize*) [inline], [virtual]

Given a destination tile size, calculate input tile size. Similar to SrcArea, and should seldom be overridden.

Parameters

<i>dstTileSize</i>	The destination tile size that is targeted for output.
--------------------	--

Return values

<i>The</i>	source tile size needed to compute a tile of the destination size.
------------	--

Reimplemented from [dng_filter_task](#).

6.36.1 Detailed Description

Represents a task which filters an area of a source [dng_image](#) to an area of a destination [dng_image](#).

6.36.2 Constructor & Destructor Documentation

6.36.2.1 `dng_filter_task::dng_filter_task (const dng_image & srcImage, dng_image & dstImage)`

Construct a filter task given a source and destination images.

Parameters

<i>srcImage</i>	Image from which source pixels are read.
<i>dstImage</i>	Image to which result pixels are written.

6.36.3 Member Function Documentation

6.36.3.1 `void dng_filter_task::Process (uint32 threadIndex, const dng_rect & area, dng_abort_sniffer * sniffer)`
[virtual]

Process one tile or partitioned area. Should not be overridden. Instead, override `ProcessArea`, which is where to implement filter processing for a specific type of [dng_filter_task](#). There is no allocator parameter as all allocation should be done in `Start`.

Parameters

<i>threadIndex</i>	0 to <code>threadCount</code> - 1 index indicating which thread this is. (Can be used to get a thread-specific buffer allocated in the <code>Start</code> method.)
<i>area</i>	Size of tiles to be used for sizing buffers, etc. (Edges of processing can be smaller.)
<i>sniffer</i>	dng_abort_sniffer to use to check for user cancellation and progress updates.

Implements [dng_area_task](#).

References `dng_memory_block::Buffer()`, `dng_image::edge_repeat`, `dng_image::Get()`, `ProcessArea()`, `dng_image::Put()`, and `SrcArea()`.

6.36.3.2 `virtual void dng_filter_task::ProcessArea (uint32 threadIndex, dng_pixel_buffer & srcBuffer, dng_pixel_buffer & dstBuffer) [pure virtual]`

Implements filtering operation from one buffer to another. Source and destination pixels are set up in member fields of this class. Ideally, no allocation should be done in this routine.

Parameters

<i>threadIndex</i>	The thread on which this routine is being called, between 0 and threadCount - 1 for the threadCount passed to Start method.
<i>srcBuffer</i>	Input area and source pixels.
<i>dstBuffer</i>	Output area and destination pixels.

Implemented in [dng_fast_interpolator](#), [dng_filter_warp](#), [dng_render_task](#), [dng_resample_task](#), and [dng_filter_opcode_task](#).

Referenced by Process().

6.36.3.3 `virtual dng_rect dng_filter_task::SrcArea (const dng_rect & dstArea) [inline], [virtual]`

Compute the source area needed for a given destination area. Default implementation assumes destination area is equal to source area for all cases.

Parameters

<i>dstArea</i>	Area to for which pixels will be computed.
----------------	--

Return values

<i>The</i>	source area needed as input to calculate the requested destination area.
------------	--

Reimplemented in [dng_fast_interpolator](#), [dng_filter_warp](#), [dng_render_task](#), [dng_resample_task](#), and [dng_filter_opcode_task](#).

Referenced by Process(), and SrcTileSize().

6.36.3.4 `virtual dng_point dng_filter_task::SrcTileSize (const dng_point & dstTileSize) [inline], [virtual]`

Given a destination tile size, calculate input tile size. Similar to SrcArea, and should seldom be overridden.

Parameters

<i>dstTileSize</i>	The destination tile size that is targeted for output.
--------------------	--

Return values

<i>The</i>	source tile size needed to compute a tile of the destination size.
------------	--

Reimplemented in [dng_filter_warp](#), [dng_resample_task](#), and [dng_filter_opcode_task](#).

References SrcArea().

Referenced by Start().

6.36.3.5 `void dng_filter_task::Start (uint32 threadCount, const dng_point & tileSize, dng_memory_allocator * allocator, dng_abort_sniffer * sniffer) [virtual]`

Called prior to processing on specific threads. Can be used to allocate per-thread memory buffers, etc.

Parameters

<i>threadCount</i>	Total number of threads that will be used for processing. Less than or equal to MaxThreads of dng_area_task .
<i>tileSize</i>	Size of source tiles which will be processed. (Not all tiles will be this size due to edge conditions.)
<i>allocator</i>	dng_memory_allocator to use for allocating temporary buffers, etc.
<i>sniffer</i>	Sniffer to test for user cancellation and to set up progress.

Reimplemented from [dng_area_task](#).

Reimplemented in [dng_render_task](#), [dng_resample_task](#), and [dng_filter_opcode_task](#).

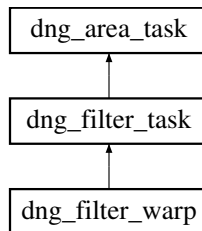

References [dng_memory_allocator::Allocate\(\)](#), and [SrcTileSize\(\)](#).

6.37.1 Member Function Documentation

6.37.1.1 void dng_filter_warp::ProcessArea (uint32 *threadIndex*, dng_pixel_buffer & *srcBuffer*, dng_pixel_buffer & *dstBuffer*) [virtual]

Implements filtering operation from one buffer to another. Source and destination pixels are set up in member fields of this class. Ideally, no allocation should be done in this routine.

Parameters

<i>threadIndex</i>	The thread on which this routine is being called, between 0 and threadCount - 1 for the threadCount passed to Start method.
<i>srcBuffer</i>	Input area and source pixels.
<i>dstBuffer</i>	Output area and destination pixels.

Implements [dng_filter_task](#).

References [dng_pixel_buffer::ConstPixel_real32\(\)](#), [dng_pixel_buffer::DirtyPixel_real32\(\)](#), and [dng_pixel_buffer::RowStep\(\)](#).

6.37.1.2 dng_rect dng_filter_warp::SrcArea (const dng_rect & *dstArea*) [virtual]

Compute the source area needed for a given destination area. Default implementation assumes destination area is equal to source area for all cases.

Parameters

<i>dstArea</i>	Area to for which pixels will be computed.
----------------	--

Return values

<i>The</i>	source area needed as input to calculate the requested destination area.
------------	--

Reimplemented from [dng_filter_task](#).

Referenced by [SrcTileSize\(\)](#).

6.37.1.3 dng_point dng_filter_warp::SrcTileSize (const dng_point & *dstTileSize*) [virtual]

Given a destination tile size, calculate input tile size. Similar to SrcArea, and should seldom be overridden.

Parameters

<i>dstTileSize</i>	The destination tile size that is targeted for output.
--------------------	--

Return values

<i>The</i>	source tile size needed to compute a tile of the destination size.
------------	--

Reimplemented from [dng_filter_task](#).

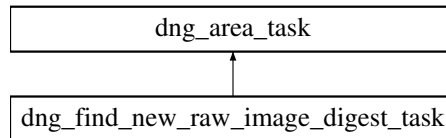

References [dng_image::Bounds\(\)](#), [DNG_REQUIRE](#), [dng_warp_params::MaxSrcRadiusGap\(\)](#), [dng_warp_params::MaxSrcTanGap\(\)](#), and [SrcArea\(\)](#).

- [dng_fingerprint Result](#) ()

Additional Inherited Members

6.38.1 Member Function Documentation

6.38.1.1 virtual void [dng_find_new_raw_image_digest_task::Process](#) (uint32 *threadIndex*, const [dng_rect](#) & *tile*, [dng_abort_sniffer](#) * *sniffer*) [inline],[virtual]

Process one tile or fully partitioned area. This method is overridden by derived classes to implement the actual image processing. Note that the sniffer can be ignored if it is certain that a processing task will complete very quickly. This method should never be called directly but rather accessed via [Process](#). There is no allocator parameter as all allocation should be done in [Start](#).

Parameters

<i>threadIndex</i>	0 to threadCount - 1 index indicating which thread this is. (Can be used to get a thread-specific buffer allocated in the Start method.)
<i>tile</i>	Area to process.
<i>sniffer</i>	dng_abort_sniffer to use to check for user cancellation and progress updates.

Implements [dng_area_task](#).

Static Public Attributes

- static const size_t **kDNGFingerprintSize** = 16

6.39.1 Detailed Description

Container fingerprint (MD5 only at present).

6.39.2 Member Function Documentation

6.39.2.1 uint32 dng_fingerprint::Collapse32 () const

Produce a 32-bit hash value from fingerprint used for faster hashing of fingerprints.

6.39.2.2 bool dng_fingerprint::FromUtf8HexString (const char inputStr[2 * kDNGFingerprintSize+1])

Convert UTF-8 string to fingerprint. Returns true on success, false on failure.

Parameters

<i>inputStr</i>	The input array from which the UTF-8 encoding of the fingerprint will be read.
-----------------	--

Return values

<i>True</i>	indicates success.
-------------	--------------------

6.39.2.3 void dng_fingerprint::ToUtf8HexString (char resultStr[2 * kDNGFingerprintSize+1]) const

Convert fingerprint to UTF-8 string.

Parameters

<i>resultStr</i>	The output array to which the UTF-8 encoding of the fingerprint will be written.
------------------	--

The documentation for this class was generated from the following files:

- [dng_fingerprint.h](#)
- [dng_fingerprint.cpp](#)

6.40 dng_fingerprint_less_than Struct Reference

Utility to compare fingerprints (e.g., for sorting).

```
#include <dng_fingerprint.h>
```

Public Member Functions

- bool [operator\(\)](#) (const [dng_fingerprint](#) &a, const [dng_fingerprint](#) &b) const
Less-than comparison.

6.40.1 Detailed Description

Utility to compare fingerprints (e.g., for sorting).

The documentation for this struct was generated from the following file:

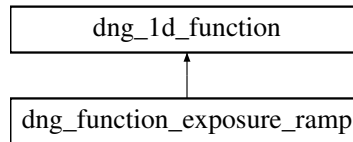

- [dng_fingerprint.h](#)

6.41 dng_function_exposure_ramp Class Reference

Curve for pre-exposure-compensation adjustment based on noise floor, shadows, and highlight level.

```
#include <dng_render.h>
```

Inheritance diagram for dng_function_exposure_ramp:

Public Member Functions

- **dng_function_exposure_ramp** (real64 white, real64 black, real64 minBlack)
- virtual real64 [Evaluate](#) (real64 x) const

Public Attributes

- real64 **fSlope**
- real64 **fBlack**
- real64 **fRadius**
- real64 **fQScale**

6.41.1 Detailed Description

Curve for pre-exposure-compensation adjustment based on noise floor, shadows, and highlight level.

6.41.2 Member Function Documentation

6.41.2.1 real64 dng_function_exposure_ramp::Evaluate (real64 x) const [virtual]

Return the mapping for value x. This method must be implemented by a derived class of [dng_1d_function](#) and the derived class determines the lookup method and function used.

Parameters

x	A value between 0.0 and 1.0 (inclusive).
---	--

Return values

<i>Mapped</i>	value for x
---------------	-------------

Implements [dng_1d_function](#).

The documentation for this class was generated from the following files:

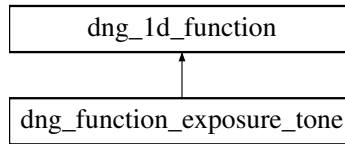

- [dng_render.h](#)
- [dng_render.cpp](#)

6.42 dng_function_exposure_tone Class Reference

Exposure compensation curve for a given compensation amount in stops using quadric for roll-off.

```
#include <dng_render.h>
```

Inheritance diagram for dng_function_exposure_tone:

Public Member Functions

- **dng_function_exposure_tone** (real64 exposure)
- virtual real64 [Evaluate](#) (real64 x) const
Returns output value for a given input tone.

Protected Attributes

- bool **fIsNOP**
- real64 **fSlope**
- real64 **a**
- real64 **b**
- real64 **c**

6.42.1 Detailed Description

Exposure compensation curve for a given compensation amount in stops using quadric for roll-off.

The documentation for this class was generated from the following files:

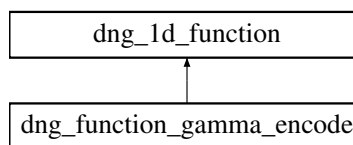

- [dng_render.h](#)
- `dng_render.cpp`

6.43 dng_function_gamma_encode Class Reference

Encoding gamma curve for a given color space.

```
#include <dng_render.h>
```

Inheritance diagram for dng_function_gamma_encode:

Public Member Functions

- **dng_function_gamma_encode** (const [dng_color_space](#) &space)
- virtual real64 [Evaluate](#) (real64 x) const

Protected Attributes

- const [dng_color_space](#) & **fSpace**

6.43.1 Detailed Description

Encoding gamma curve for a given color space.

6.43.2 Member Function Documentation

6.43.2.1 virtual real64 dng_function_gamma_encode::Evaluate (real64 x) const [virtual]

Return the mapping for value x. This method must be implemented by a derived class of [dng_1d_function](#) and the derived class determines the lookup method and function used.

Parameters

x	A value between 0.0 and 1.0 (inclusive).
---	--

Return values

<i>Mapped</i>	value for x
---------------	-------------

Implements [dng_1d_function](#).

The documentation for this class was generated from the following file:

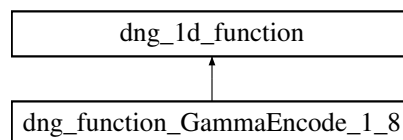

- [dng_render.h](#)

6.44 dng_function_GammaEncode_1_8 Class Reference

A [dng_1d_function](#) for gamma encoding with 1.8 gamma.

```
#include <dng_color_space.h>
```

Inheritance diagram for dng_function_GammaEncode_1_8:

Public Member Functions

- virtual real64 [Evaluate](#) (real64 x) const
- virtual real64 [EvaluateInverse](#) (real64 y) const

Static Public Member Functions

- static const [dng_1d_function](#) & **Get** ()

6.44.1 Detailed Description

A [dng_1d_function](#) for gamma encoding with 1.8 gamma.

6.44.2 Member Function Documentation

6.44.2.1 `real64 dng_function_GammaEncode_1_8::Evaluate (real64 x) const` `[virtual]`

Return the mapping for value x. This method must be implemented by a derived class of [dng_1d_function](#) and the derived class determines the lookup method and function used.

Parameters

x	A value between 0.0 and 1.0 (inclusive).
---	--

Return values

<i>Mapped</i>	value for x
---------------	-------------

Implements [dng_1d_function](#).

6.44.2.2 `real64 dng_function_GammaEncode_1_8::EvaluateInverse (real64 y) const` `[virtual]`

Return the reverse mapped value for y. This method can be implemented by derived classes. The default implementation uses Newton's method to solve for x such that Evaluate(x) == y.

Parameters

y	A value to reverse map. Should be within the range of the function implemented by this dng_1d_function .
---	--

Return values

A	value x such that Evaluate(x) == y (to very close approximation).
---	---

Reimplemented from [dng_1d_function](#).

The documentation for this class was generated from the following files:

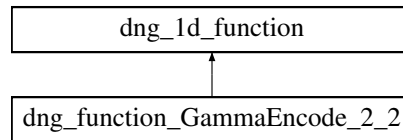

- [dng_color_space.h](#)
- [dng_color_space.cpp](#)

6.45 dng_function_GammaEncode_2_2 Class Reference

A [dng_1d_function](#) for gamma encoding with 2.2 gamma.

```
#include <dng_color_space.h>
```

- static const [dng_1d_function](#) & [Get](#) ()

6.45.1 Detailed Description

A [dng_1d_function](#) for gamma encoding with 2.2 gamma.

6.45.2 Member Function Documentation

6.45.2.1 real64 [dng_function_GammaEncode_2_2::Evaluate](#) (real64 x) const `[virtual]`

Return the mapping for value x. This method must be implemented by a derived class of [dng_1d_function](#) and the derived class determines the lookup method and function used.

Parameters

x	A value between 0.0 and 1.0 (inclusive).
---	--

Return values

<i>Mapped</i>	value for x
---------------	-------------

Implements [dng_1d_function](#).

6.45.2.2 real64 [dng_function_GammaEncode_2_2::EvaluateInverse](#) (real64 y) const `[virtual]`

Return the reverse mapped value for y. This method can be implemented by derived classes. The default implementation uses Newton's method to solve for x such that `Evaluate(x) == y`.

Parameters

y	A value to reverse map. Should be within the range of the function implemented by this dng_1d_function .
---	--

Return values

A	value x such that <code>Evaluate(x) == y</code> (to very close approximation).
---	--

Reimplemented from [dng_1d_function](#).

The documentation for this class was generated from the following files:

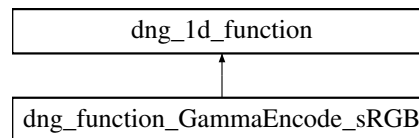

- [dng_color_space.h](#)

6.46 dng_function_GammaEncode_sRGB Class Reference

A [dng_1d_function](#) for gamma encoding in sRGB color space.

```
#include <dng_color_space.h>
```

Inheritance diagram for [dng_function_GammaEncode_sRGB](#):

Public Member Functions

- virtual real64 [Evaluate](#) (real64 x) const
- virtual real64 [EvaluateInverse](#) (real64 y) const

Static Public Member Functions

- static const [dng_1d_function](#) & [Get](#) ()

6.46.1 Detailed Description

A [dng_1d_function](#) for gamma encoding in sRGB color space.

6.46.2 Member Function Documentation

6.46.2.1 real64 [dng_function_GammaEncode_sRGB::Evaluate](#) (real64 x) const [virtual]

Return the mapping for value x. This method must be implemented by a derived class of [dng_1d_function](#) and the derived class determines the lookup method and function used.

Parameters

x	A value between 0.0 and 1.0 (inclusive).
---	--

Return values

<i>Mapped</i>	value for x
---------------	-------------

Implements [dng_1d_function](#).

6.46.2.2 `real64 dng_function_GammaEncode_sRGB::EvaluateInverse (real64 y) const` [virtual]

Return the reverse mapped value for y. This method can be implemented by derived classes. The default implementation uses Newton's method to solve for x such that Evaluate(x) == y.

Parameters

y	A value to reverse map. Should be within the range of the function implemented by this dng_1d_function .
---	--

Return values

A	value x such that Evaluate(x) == y (to very close approximation).
---	---

Reimplemented from [dng_1d_function](#).

The documentation for this class was generated from the following files:

- [dng_color_space.h](#)
- [dng_color_space.cpp](#)

6.47 dng_gain_map Class Reference

Holds a discrete (i.e., sampled) 2D representation of a gain map. This is effectively an image containing scale factors.

```
#include <dng_gain_map.h>
```

Public Member Functions

- [dng_gain_map](#) ([dng_memory_allocator](#) &allocator, const [dng_point](#) &points, const [dng_point_real64](#) &spacing, const [dng_point_real64](#) &origin, uint32 planes)
- const [dng_point](#) & [Points](#) () const
The number of samples in the horizontal and vertical directions.
- const [dng_point_real64](#) & [Spacing](#) () const
- const [dng_point_real64](#) & [Origin](#) () const
The 2D coordinate for the first (i.e., top-left-most) sample.
- uint32 [Planes](#) () const
The number of color planes.
- real32 & [Entry](#) (uint32 rowIndex, uint32 colIndex, uint32 plane)
Getter for a gain map sample (specified by row, column, and plane).
- const real32 & [Entry](#) (uint32 rowIndex, uint32 colIndex, uint32 plane) const
- real32 [Interpolate](#) (int32 row, int32 col, uint32 plane, const [dng_rect](#) &bounds) const
- uint32 [PutStreamSize](#) () const
The number of bytes needed to hold the gain map data.
- void [PutStream](#) ([dng_stream](#) &stream) const
Write the gain map to the specified stream.

Static Public Member Functions

- static [dng_gain_map](#) * [GetStream](#) ([dng_host](#) &host, [dng_stream](#) &stream)
Read a gain map from the specified stream.

6.47.1 Detailed Description

Holds a discrete (i.e., sampled) 2D representation of a gain map. This is effectively an image containing scale factors.

6.47.2 Constructor & Destructor Documentation

6.47.2.1 `dng_gain_map::dng_gain_map (dng_memory_allocator & allocator, const dng_point & points, const dng_point_real64 & spacing, const dng_point_real64 & origin, uint32 planes)`

Construct a gain map with the specified memory allocator, number of samples (points), sample spacing, origin, and number of color planes.

References `dng_memory_allocator::Allocate()`, and `AutoPtr< T >::Reset()`.

6.47.3 Member Function Documentation

6.47.3.1 `const real32& dng_gain_map::Entry (uint32 rowIndex, uint32 colIndex, uint32 plane) const [inline]`

Getter for a gain map sample (specified by row index, column index, and plane index).

References `dng_memory_block::Buffer_real32()`.

6.47.3.2 `real32 dng_gain_map::Interpolate (int32 row, int32 col, uint32 plane, const dng_rect & bounds) const`

Compute the interpolated gain (i.e., scale factor) at the specified pixel position and color plane, within the specified image bounds (in pixels).

6.47.3.3 `const dng_point_real64& dng_gain_map::Spacing () const [inline]`

The space between adjacent samples in the horizontal and vertical directions.

The documentation for this class was generated from the following files:

Inheritance diagram for `dng_gamma_encode_proxy`:

Public Member Functions

- **dng_gamma_encode_proxy** (real64 black, real64 white, bool isSceneReferred)
- virtual real64 [Evaluate](#) (real64 x) const

6.49.1 Member Function Documentation

6.49.1.1 virtual real64 dng_gamma_encode_proxy::Evaluate (real64 x) const `[inline], [virtual]`

Return the mapping for value x. This method must be implemented by a derived class of [dng_1d_function](#) and the derived class determines the lookup method and function used.

Parameters

x	A value between 0.0 and 1.0 (inclusive).
---	--

Return values

<i>Mapped</i>	value for x
---------------	-------------

Implements [dng_1d_function](#).

References DNG_ASSERT.

The documentation for this class was generated from the following file:

- dng_negative.cpp

6.50 dng_host Class Reference

The main class for communication between the application and the DNG SDK. Used to customize memory allocation and other behaviors.

```
#include <dng_host.h>
```

Public Member Functions

- [dng_host](#) ([dng_memory_allocator](#) *allocator=NULL, [dng_abort_sniffer](#) *sniffer=NULL)
- virtual [~dng_host](#) ()
- [dng_memory_allocator](#) & [Allocator](#) ()
Getter for host's memory allocator.
- virtual [dng_memory_block](#) * [Allocate](#) (uint32 logicalSize)
- void [SetSniffer](#) ([dng_abort_sniffer](#) *sniffer)
Setter for host's abort sniffer.
- [dng_abort_sniffer](#) * [Sniffer](#) ()

Getter for host's abort sniffer.

- virtual void [SniffForAbort](#) ()
- void [SetNeedsMeta](#) (bool needs)
- bool [NeedsMeta](#) () const

Getter for flag determining whether all XMP metadata should be parsed.

- void [SetNeedsImage](#) (bool needs)
- bool [NeedsImage](#) () const

Setter for flag determining whether DNG image data is needed.

- void [SetForPreview](#) (bool preview)
- bool [ForPreview](#) () const
- void [SetMinimumSize](#) (uint32 size)
- uint32 [MinimumSize](#) () const

Getter for the minimum preview size.

- void [SetPreferredSize](#) (uint32 size)
- uint32 [PreferredSize](#) () const

Getter for the preferred preview size.

- void [SetMaximumSize](#) (uint32 size)
- uint32 [MaximumSize](#) () const

Getter for the maximum preview size.

- void [SetCropFactor](#) (real64 cropFactor)
- real64 [CropFactor](#) () const

Getter for the cropping factor.

- void [ValidateSizes](#) ()

Makes sures minimum, preferred, and maximum sizes are reasonable.

- void [SetSaveDNGVersion](#) (uint32 version)
- virtual uint32 [SaveDNGVersion](#) () const

Getter for what version to save DNG file compatible with.

- void [SetSaveLinearDNG](#) (bool linear)
- virtual bool [SaveLinearDNG](#) (const [dng_negative](#) &negative) const

Getter for flag determining whether to save a linear DNG file.

- void [SetKeepOriginalFile](#) (bool keep)
- bool [KeepOriginalFile](#) ()

Getter for flag determining whether to keep original RAW file data.

- virtual bool [IsTransientError](#) ([dng_error_code](#) code)

- virtual void [ResampleImage](#) (const [dng_image](#) &srcImage, [dng_image](#) &dstImage)

6.50.1 Detailed Description

The main class for communication between the application and the DNG SDK. Used to customize memory allocation and other behaviors.

[dng_host](#) allows setting parameters for the DNG conversion, mediates callback style interactions between the host application and the DNG SDK, and allows controlling certain internal behavior of the SDK such as memory allocation. Many applications will be able to use the default implementation of [dng_host](#) by just setting the [dng_memory_allocator](#) and [dng_abort_sniffer](#) in the constructor. More complex interactions will require deriving a class from [dng_host](#).

Multiple [dng_host](#) objects can be allocated in a single process. This may be useful for DNG processing on separate threads. (Distinct [dng_host](#) objects are completely threadsafe for read/write. The application is responsible for establishing mutual exclusion for read/write access to a single [dng_host](#) object if it is used in multiple threads.)

6.50.2 Constructor & Destructor Documentation

6.50.2.1 `dng_host::dng_host (dng_memory_allocator * allocator = NULL, dng_abort_sniffer * sniffer = NULL)`

Allocate a [dng_host](#) object, possibly with custom allocator and sniffer.

Parameters

<i>allocator</i>	Allows controlling all memory allocation done via this dng_host . Defaults to singleton global dng_memory_allocator , which calls new/delete dng_malloc_block for appropriate size.
<i>sniffer</i>	Used to periodically check if pending DNG conversions should be aborted and to communicate progress updates. Defaults to singleton global dng_abort_sniffer , which never aborts and ignores progress updated.

6.50.2.2 `dng_host::~~dng_host () [virtual]`

Clean up direct memory for [dng_host](#). Memory allocator and abort sniffer are not deleted. Objects such as [dng_image](#) and others returned from host can still be used after host is deleted.

6.50.3 Member Function Documentation

6.50.3.1 `dng_memory_block * dng_host::Allocate (uint32 logicalSize) [virtual]`

Allocate a new [dng_memory_block](#) using the host's memory allocator. Uses the [Allocator\(\)](#) property of host to allocate a new block of memory. Will call [ThrowMemoryFull](#) if block cannot be allocated.

Parameters

<i>logicalSize</i>	Number of usable bytes returned dng_memory_block must contain.
--------------------	--

References [dng_memory_allocator::Allocate\(\)](#), and [Allocator\(\)](#).

Referenced by [dng_opcode_MapTable::dng_opcode_MapTable\(\)](#), [dng_mosaic_info::InterpolateGeneric\(\)](#), [dng_jpeg_image_encode_task::Process\(\)](#), [dng_read_tiles_task::Process\(\)](#), [dng_write_tiles_task::Process\(\)](#), and [dng_read_image::Read\(\)](#).

6.50.3.2 `void dng_host::ApplyOpcodeList (dng_opcode_list & list, dng_negative & negative, AutoPtr< dng_image > & image) [virtual]`

Factory method to apply a [dng_opcode_list](#). Can be used to override opcode list applications.

References `dng_opcode_list::Apply()`.

6.50.3.3 `bool dng_host::ForPreview () const [inline]`

Getter for flag determining whether image should be preview quality. Preview quality images may be rendered more quickly. Current DNG SDK does not change rendering behavior based on this flag, but derived versions may use this getter to choose between a slower more accurate path and a faster "good enough for preview" one. Data produce with `ForPreview` set to true should not be written back to a DNG file, except as a preview image.

Referenced by `dng_opcode::AboutToApply()`.

6.50.3.4 `bool dng_host::IsTransientError (dng_error_code code) [virtual]`

Determine if an error is the result of a temporary, but planned-for occurrence such as user cancellation or memory exhaustion. This method is sometimes used to determine whether to try and continue processing a DNG file despite errors in the file format, etc. In such cases, processing will be continued if `IsTransientError` returns false. This is so that user cancellation and memory exhaustion always terminate processing.

Parameters

<i>code</i>	Error to test for transience.
-------------	-------------------------------

References `dng_error_memory`, and `dng_error_user_canceled`.

6.50.3.5 `dng_exif * dng_host::Make_dng_exif () [virtual]`

Factory method for `dng_exif` class. Can be used to customize allocation or to ensure a derived class is used instead of `dng_exif`.

References `ThrowMemoryFull()`.

Referenced by `dng_info::Parse()`.

6.50.3.6 `dng_ifd * dng_host::Make_dng_ifd () [virtual]`

Factory method for `dng_ifd` class. Can be used to customize allocation or to ensure a derived class is used instead of `dng_ifd`.

References `ThrowMemoryFull()`.

Referenced by `dng_info::Parse()`.

6.50.3.7 `dng_image * dng_host::Make_dng_image (const dng_rect & bounds, uint32 planes, uint32 pixelType) [virtual]`

Factory method for `dng_image` class. Can be used to customize allocation or to ensure a derived class is used instead of `dng_simple_image`.

References `Allocator()`, and `ThrowMemoryFull()`.

Referenced by `dng_filter_opcode::Apply()`, `dng_opcode_WarpRectilinear::Apply()`, `dng_opcode_WarpFisheye::Apply()`, and `dng_render::Render()`.

6.50.3.8 `dng_negative * dng_host::Make_dng_negative () [virtual]`

Factory method for `dng_negative` class. Can be used to customize allocation or to ensure a derived class is used instead of `dng_negative`.

6.50.3.9 dng_opcode * dng_host::Make_dng_opcode (uint32 opcodeID, dng_stream & stream) [virtual]

Factory method for parsing [dng_opcode](#) based classs. Can be used to override opcode implementations.

References [ThrowMemoryFull\(\)](#).

Referenced by [dng_opcode_list::Parse\(\)](#).

6.50.3.10 dng_shared * dng_host::Make_dng_shared () [virtual]

Factory method for [dng_shared](#) class. Can be used to customize allocation or to ensure a derived class is used instead of [dng_shared](#).

References [ThrowMemoryFull\(\)](#).

Referenced by [dng_info::Parse\(\)](#).

6.50.3.11 dng_xmp * dng_host::Make_dng_xmp () [virtual]

Factory method for [dng_xmp](#) class. Can be used to customize allocation or to ensure a derived class is used instead of [dng_xmp](#).

References [Allocator\(\)](#), and [ThrowMemoryFull\(\)](#).

6.50.3.12 void dng_host::PerformAreaTask (dng_area_task & task, const dng_rect & area) [virtual]

General top-level bottleneck for image processing tasks. Default implementation calls [dng_area_task::PerformAreaTask](#) method on task. Can be overridden in derived classes to support multiprocessing, for example.

Parameters

<i>task</i>	Image processing task to perform on area.
<i>area</i>	Rectangle over which to perform image processing task.

References [Allocator\(\)](#), [dng_area_task::Perform\(\)](#), and [Sniffer\(\)](#).

Referenced by [dng_filter_opcode::Apply\(\)](#), [dng_opcode_WarpRectilinear::Apply\(\)](#), [dng_inplace_opcode::Apply\(\)](#), [dng_opcode_WarpFisheye::Apply\(\)](#), [dng_mosaic_info::InterpolateFast\(\)](#), [dng_linearization_info::Linearize\(\)](#), [dng_read_image::Read\(\)](#), and [dng_render::Render\(\)](#).

6.50.3.13 uint32 dng_host::PerformAreaTaskThreads () [virtual]

How many multiprocessing threads does [PerformAreaTask](#) use? Default implementation always returns 1 since it is single threaded.

Referenced by [dng_read_image::Read\(\)](#).

6.50.3.14 void dng_host::ResampleImage (const dng_image & srcImage, dng_image & dstImage) [virtual]

Factory method to resample an image. Can be used to override image method used to resample images.

References [dng_image::Bounds\(\)](#).

6.50.3.15 void dng_host::SetCropFactor (real64 cropFactor) [inline]

Setter for the cropping factor.

Parameters

<i>cropFactor</i>	Fraction of image to be used after crop.
-------------------	--

6.50.3.16 void dng_host::SetForPreview (bool *preview*) [inline]

Setter for flag determining whether image should be preview quality, or full quality.

Parameters

<i>preview</i>	If true, rendered images are for preview.
----------------	---

6.50.3.17 void dng_host::SetKeepOriginalFile (bool *keep*) [inline]

Setter for flag determining whether to keep original RAW file data.

Parameters

<i>keep</i>	If true, original RAW data will be kept.
-------------	--

6.50.3.18 void dng_host::SetMaximumSize (uint32 *size*) [inline]

Setter for the maximum preview size.

Parameters

<i>size</i>	Maximum pixel size (long side of image).
-------------	--

6.50.3.19 void dng_host::SetMinimumSize (uint32 *size*) [inline]

Setter for the minimum preview size.

Parameters

<i>size</i>	Minimum pixel size (long side of image).
-------------	--

Referenced by ValidateSizes().

6.50.3.20 void dng_host::SetNeedsImage (bool *needs*) [inline]

Setter for flag determining whether DNG image data is needed. Defaults to true. Image data might not be needed for applications which only manipulate metadata.

Parameters

<i>needs</i>	If true, image data is needed.
--------------	--------------------------------

6.50.3.21 void dng_host::SetNeedsMeta (bool *needs*) [inline]

Setter for flag determining whether all XMP metadata should be parsed. Defaults to true. One might not want metadata when doing a quick check to see if a file is readable.

Parameters

<i>needs</i>	If true, metadata is needed.
--------------	------------------------------

6.50.3.22 void dng_host::SetPreferredSize (uint32 *size*) [inline]

Setter for the preferred preview size.

Parameters

<i>size</i>	Preferred pixel size (long side of image).
-------------	--

Referenced by ValidateSizes().

6.50.3.23 void dng_host::SetSaveDNGVersion (uint32 *version*) [inline]

Setter for what version to save DNG file compatible with.

Parameters

<i>version</i>	What version to save DNG file compatible with.
----------------	--

6.50.3.24 void dng_host::SetSaveLinearDNG (bool *linear*) [inline]

Setter for flag determining whether to force saving a linear DNG file.

Parameters

<i>linear</i>	If true, we should force saving a linear DNG file.
---------------	--

6.50.3.25 void dng_host::SniffForAbort () [virtual]

Check for pending abort. Should call ThrowUserCanceled if an abort is pending.

References Sniffer().

Referenced by dng_mosaic_info::InterpolateGeneric(), and dng_read_image::Read().

6.51 dng_hue_sat_map Class Reference

A 3D table that maps HSV (hue, saturation, and value) floating-point input coordinates in the range [0,1] to delta signals. The table must have at least 1 sample in the hue dimension, at least 2 samples in the saturation dimension, and at least 1 sample in the value dimension. Tables are stored in value-hue-saturation order.

```
#include <dng_hue_sat_map.h>
```

6.51.1 Detailed Description

A 3D table that maps HSV (hue, saturation, and value) floating-point input coordinates in the range [0,1] to delta signals. The table must have at least 1 sample in the hue dimension, at least 2 samples in the saturation dimension, and at least 1 sample in the value dimension. Tables are stored in value-hue-saturation order.

6.51.2 Member Function Documentation

6.51.2.1 const `HSBModify`* `dng_hue_sat_map::GetConstDeltas` () const `[inline]`

Direct read-only access to table entries. The entries are stored in value-hue-saturation order (outer to inner).

References `dng_ref_counted_block::Buffer_real32()`.

Referenced by `GetDelta()`, `Interpolate()`, and `operator==()`.

6.51.2.2 HSBModify* dng_hue_sat_map::GetDeltas () [inline]

Direct read/write access to table entries. The entries are stored in value-hue-saturation order (outer to inner).

References `dng_ref_counted_block::Buffer_real32()`, and `EnsureWriteable()`.

6.51.2.3 dng_hue_sat_map* dng_hue_sat_map::Interpolate (const dng_hue_sat_map & map1, const dng_hue_sat_map & map2, real64 weight1) [static]

Compute a linearly-interpolated hue sat map (i.e., delta and scale factors) from the specified tables, with the specified weight. map1 and map2 must have the same dimensions.

References `DeltasCount()`, `dng_hue_sat_map()`, `DNG_REPORT`, `GetConstDeltas()`, `IsValid()`, `AutoPtr< T >::Release()`, `SetDivisions()`, and `ThrowProgramError()`.

Referenced by `dng_camera_profile::HueSatMapForWhite()`.

6.51.2.4 void dng_hue_sat_map::SetDivisions (uint32 hueDivisions, uint32 satDivisions, uint32 valDivisions = 1)

Set the table dimensions (number of samples in each dimension). This erases any existing table data.

References `dng_ref_counted_block::Allocate()`, `DeltasCount()`, and `DNG_ASSERT`.

Referenced by `Interpolate()`.

6.53.1 Detailed Description

Base class for holding image data in DNG SDK. See [dng_simple_image](#) for derived class most often used in DNG SDK.

6.53.2 Member Enumeration Documentation

6.53.2.1 enum dng_image::edge_option

How to handle requests to get image areas outside the image bounds.

Enumerator:

edge_none Leave edge pixels unchanged.

edge_zero Pad with zeros.

edge_repeat Repeat edge pixels.

edge_repeat_zero_last Repeat edge pixels, except for last plane which is zero padded.

6.53.3 Member Function Documentation

6.53.3.1 void dng_image::CopyArea (const dng_image & src, const dng_rect & area, uint32 srcPlane, uint32 dstPlane, uint32 planes)

Copy image data from an area of one image to same area of another.

Parameters

<i>src</i>	Image to copy from.
<i>area</i>	Rectangle of images to copy.
<i>srcPlane</i>	Plane to start copying in src.
<i>dstPlane</i>	Plane to start copying in this.
<i>planes</i>	Number of planes to copy.

References [dng_pixel_buffer::CopyArea\(\)](#).

Referenced by [CopyArea\(\)](#).

6.53.3.2 void dng_image::CopyArea (const dng_image & src, const dng_rect & area, uint32 plane, uint32 planes) [inline]

Copy image data from an area of one image to same area of another.

Parameters

<i>src</i>	Image to copy from.
<i>area</i>	Rectangle of images to copy.
<i>plane</i>	Plane to start copying in src and this.
<i>planes</i>	Number of planes to copy.

References [CopyArea\(\)](#).

6.53.3.3 bool dng_image::EqualArea (const dng_image & rhs, const dng_rect & area, uint32 plane, uint32 planes) const

Return true if the contents of an area of the image are the same as those of another.

Parameters

<i>rhs</i>	Image to compare against.
<i>area</i>	Rectangle of image to test.
<i>plane</i>	Plane to start comparing.
<i>planes</i>	Number of planes to compare.

References `dng_pixel_buffer::EqualArea()`.

6.53.3.4 `void dng_image::Get (dng_pixel_buffer & buffer, edge_option edgeOption = edge_none, uint32 repeatV = 1, uint32 repeatH = 1) const`

Get a pixel buffer of data on image with proper edge padding.

Parameters

<i>buffer</i>	Receives resulting pixel buffer.
<i>edgeOption</i>	edge_option describing how to pad edges.
<i>repeatV</i>	Amount of repeated padding needed in vertical for edge_repeat and edge_repeat_zero_last edge-Option cases.
<i>repeatH</i>	Amount of repeated padding needed in horizontal for edge_repeat and edge_repeat_zero_last edgeOption cases.

References `dng_pixel_buffer::DirtyPixel()`, and `edge_none`.

Referenced by `dng_mosaic_info::InterpolateGeneric()`, `dng_filter_task::Process()`, `dng_inplace_opcode_task::Process()`, and `dng_find_new_raw_image_digest_task::Process()`.

6.53.3.5 `uint32 dng_image::PixelRange () const`

Getter for pixel range. For unsigned types, range is 0 to return value. For signed types, range is return value - 0x8000U. For `ttFloat` type, pixel range is 0.0 to 1.0 and this routine returns 1.

Referenced by `dng_resample_task::ProcessArea()`.

6.53.3.6 `uint32 dng_image::PixelSize () const`

Getter for pixel size.

Return values

<i>Size,in</i>	bytes, of pixel type for this image .
----------------	---------------------------------------

References `PixelType()`.

Referenced by `dng_mosaic_info::InterpolateGeneric()`, and `SetPixelType()`.

6.53.3.7 `uint32 dng_image::PixelType () const` `[inline]`

Getter for pixel type.

Return values

<i>See</i>	<code>dng_tagtypes.h</code> . Valid values are <code>ttByte</code> , <code>ttShort</code> , <code>ttSShort</code> , <code>ttLong</code> , <code>ttFloat</code> .
------------	--

Referenced by `dng_filter_opcode::Apply()`, `dng_opcode_WarpRectilinear::Apply()`, `dng_opcode_WarpFisheye::Apply()`, `dng_mosaic_info::InterpolateGeneric()`, `PixelSize()`, `dng_render::Render()`, and `dng_image_writer::WriteDNG()`.

6.53.3.8 void dng_image::Put (const dng_pixel_buffer & *buffer*)

Put a pixel buffer into image.

Parameters

<i>buffer</i>	Pixel buffer to copy from.
---------------	----------------------------

References dng_pixel_buffer::ConstPixel(), and Planes().

Referenced by dng_mosaic_info::InterpolateGeneric(), dng_filter_task::Process(), and dng_inplace_opcode_task::Process().

6.53.3.9 void dng_image::Rotate (const dng_orientation & *orientation*) [virtual]

Rotate image to reflect given orientation change.

Parameters

<i>orientation</i>	Directive to rotate image in a certain way.
--------------------	---

Reimplemented in [dng_simple_image](#).

References ThrowProgramError().

6.53.3.10 void dng_image::SetPixelType (uint32 *pixelType*) [virtual]

Setter for pixel type.

Parameters

<i>pixelType</i>	The new pixel type .
------------------	----------------------

Reimplemented in [dng_simple_image](#).

References PixelSize(), and ThrowProgramError().

6.53.3.11 void dng_image::Trim (const dng_rect & *r*) [virtual]

Shrink bounds of image to given rectangle.

Parameters

<i>r</i>	Rectangle to crop to.
----------	-----------------------

Reimplemented in [dng_simple_image](#).

References Bounds(), and ThrowProgramError().

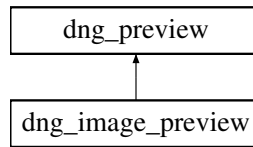

Referenced by dng_opcode_TrimBounds::Apply().

Support for writing [dng_image](#) or [dng_negative](#) instances to a [dng_stream](#) in TIFF or DNG format.

6.56.2 Member Function Documentation

6.56.2.1 `void dng_image_writer::CleanUpMetadata (dng_host & host, dng_metadata & metadata, dng_metadata_subset metadataSubset, const char * dstMIM, const char * software=NULL) [virtual]`

Resolve metadata conflicts and apply metadata policies in keeping with Metadata Working Group (MWG) guidelines.

References `dng_host::Allocator()`, and `dng_exif::CopyGPSFrom()`.

Referenced by `WriteDNG()`.

6.56.2.2 `void dng_image_writer::WriteDNG (dng_host & host, dng_stream & stream, dng_negative & negative, const dng_preview_list * previewList=NULL, uint32 maxBackwardVersion=dngVersion_SaveDefault, bool uncompressed=false)`

Write a [dng_image](#) to a [dng_stream](#) in DNG format.

Parameters

<i>host</i>	Host interface used for progress updates, abort testing, buffer allocation, etc.
<i>stream</i>	The dng_stream on which to write the TIFF.
<i>negative</i>	The image data and metadata (EXIF, IPTC, XMP) to be written.
<i>previewList</i>	List of previews (not counting thumbnail) to write to the file. Defaults to empty.
<i>maxBackward-Version</i>	The DNG file should be readable by readers at least back to this version.
<i>uncompressed</i>	True to force uncompressed images. Otherwise use normal compression.

References `dng_negative::Metadata()`.

6.56.2.3 `void dng_image_writer::WriteDNG (dng_host & host, dng_stream & stream, const dng_negative & negative, const dng_metadata & metadata, const dng_preview_list * previewList=NULL, uint32 maxBackwardVersion=dngVersion_SaveDefault, bool uncompressed=false) [virtual]`

Write a [dng_image](#) to a [dng_stream](#) in DNG format.

Parameters

<i>host</i>	Host interface used for progress updates, abort testing, buffer allocation, etc.
<i>stream</i>	The dng_stream on which to write the TIFF.
<i>negative</i>	The image data to be written.
<i>metadata</i>	The metadata (EXIF, IPTC, XMP) to be written.
<i>previewList</i>	List of previews (not counting thumbnail) to write to the file. Defaults to empty.
<i>maxBackward-Version</i>	The DNG file should be readable by readers at least back to this version.
<i>uncompressed</i>	True to force uncompressed images. Otherwise use normal compression.

6.56.2.4 `void dng_image_writer::WriteTIFF (dng_host & host, dng_stream & stream, const dng_image & image, uint32 photometricInterpretation, uint32 compression, dng_negative * negative, const dng_color_space * space = NULL, const dng_resolution * resolution = NULL, const dng_jpeg_preview * thumbnail = NULL, const dng_memory_block * imageResources = NULL, dng_metadata_subset metadataSubset = kMetadataSubset_All)`

Write a `dng_image` to a `dng_stream` in TIFF format.

Parameters

<i>host</i>	Host interface used for progress updates, abort testing, buffer allocation, etc.
<i>stream</i>	The <code>dng_stream</code> on which to write the TIFF.
<i>image</i>	The actual image data to be written.
<i>photometric-Interpretation</i>	Either <code>piBlackIsZero</code> for monochrome or <code>piRGB</code> for RGB images.
<i>compression</i>	Must be <code>ccUncompressed</code> .
<i>negative</i>	or metadata If non-NULL, EXIF, IPTC, and XMP metadata from this negative is written to TIFF.
<i>space</i>	If non-null and color space has an ICC profile, TIFF will be tagged with this profile. No color space conversion of image data occurs.
<i>resolution</i>	If non-NULL, TIFF will be tagged with this resolution.
<i>thumbnail</i>	If non-NULL, will be stored in TIFF as preview image.
<i>imageResources</i>	If non-NULL, will image resources be stored in TIFF as well.
<i>metadataSubset</i>	The subset of metadata (e.g., copyright only) to include in the TIFF.

References `dng_negative::Metadata()`.

6.56.2.5 `void dng_image_writer::WriteTIFFWithProfile (dng_host & host, dng_stream & stream, const dng_image & image, uint32 photometricInterpretation, uint32 compression, dng_negative * negative, const void * profileData = NULL, uint32 profileSize = 0, const dng_resolution * resolution = NULL, const dng_jpeg_preview * thumbnail = NULL, const dng_memory_block * imageResources = NULL, dng_metadata_subset metadataSubset = kMetadataSubset_All)`

Write a `dng_image` to a `dng_stream` in TIFF format.

Parameters

<i>host</i>	Host interface used for progress updates, abort testing, buffer allocation, etc.
<i>stream</i>	The dng_stream on which to write the TIFF.
<i>image</i>	The actual image data to be written.
<i>photometric-Interpretation</i>	Either piBlackIsZero for monochrome or piRGB for RGB images.
<i>compression</i>	Must be ccUncompressed.
<i>negative</i>	or metadata If non-NULL, EXIF, IPTC, and XMP metadata from this negative is written to TIFF.
<i>profileData</i>	If non-null, TIFF will be tagged with this profile. No color space conversion of image data occurs.
<i>profileSize</i>	The size for the profile data.
<i>resolution</i>	If non-NULL, TIFF will be tagged with this resolution.
<i>thumbnail</i>	If non-NULL, will be stored in TIFF as preview image.
<i>imageResources</i>	If non-NULL, will image resources be stored in TIFF as well.
<i>metadataSubset</i>	The subset of metadata (e.g., copyright only) to include in the TIFF.

6.57.1 Detailed Description

Top-level structure of DNG file with access to metadata.

See [DNG 1.1.0 specification](#) for information on member fields of this class.

6.57.2 Member Function Documentation

6.57.2.1 bool dng_info::IsValidDNG () [virtual]

Test validity of DNG data.

Return values

<i>true</i>	if stream provided a valid DNG.
-------------	---------------------------------

References `AutoPtr< T >::Get()`.

6.57.2.2 void dng_info::Parse ([dng_host](#) &host, [dng_stream](#) &stream) [virtual]

Read [dng_info](#) from a [dng_stream](#)

Parameters

<i>host</i>	DNG host used for progress updating, abort testing, buffer allocation, etc.
<i>stream</i>	Stream to read DNG data from.

References `AutoPtr< T >::Get()`, `dng_stream::Get_uint16()`, `dng_stream::Get_uint32()`, `dng_camera_profile::IsValid()`, `kMaxChainedIFDs`, `kMaxSubIFDs`, `dng_stream::Length()`, `dng_host::Make_dng_exif()`, `dng_host::Make_dng_ifd()`, `dng_host::Make_dng_shared()`, `dng_camera_profile::Parse()`, `dng_stream::Position()`, `dng_stream::PositionInOriginalFile()`, `AutoPtr< T >::Reset()`, `dng_stream::SetBigEndian()`, `dng_stream::SetLittleEndian()`, `dng_stream::SetReadPosition()`, and `ThrowBadFormat()`.

- **dng_inplace_opcode** (uint32 opcodeID, [dng_stream](#) &stream, const char *name)

Additional Inherited Members

6.58.1 Detailed Description

Class to represent an in-place (i.e., pointwise, per-pixel) opcode, such as a global tone curve.

6.58.2 Member Function Documentation

6.58.2.1 `virtual dng_rect dng_inplace_opcode::ModifiedBounds (const dng_rect & imageBounds) [inline], [virtual]`

The adjusted bounds (processing area) of this opcode. It is limited to the intersection of the specified image area and the GainMap area.

Reimplemented in [dng_opcode_ScalePerColumn](#), [dng_opcode_ScalePerRow](#), [dng_opcode_DeltaPerColumn](#), [dng_opcode_DeltaPerRow](#), [dng_opcode_MapPolynomial](#), [dng_opcode_GainMap](#), and [dng_opcode_MapTable](#).

Referenced by [Apply\(\)](#).

6.58.2.2 `virtual void dng_inplace_opcode::Prepare (dng_negative &, uint32, const dng_point &, const dng_rect &, uint32, uint32, dng_memory_allocator &) [inline], [virtual]`

Startup method called before any processing is performed on pixel areas. It can be used to allocate (per-thread) memory and setup tasks.

Parameters

<i>negative</i>	The negative object to be processed.
<i>threadCount</i>	The number of threads to be used to perform the processing.
<i>threadCount</i>	Total number of threads that will be used for processing. Less than or equal to MaxThreads.
<i>tileSize</i>	Size of source tiles which will be processed. (Not all tiles will be this size due to edge conditions.)
<i>imageBounds</i>	Total size of image to be processed.
<i>imagePlanes</i>	Number of planes in the image. Less than or equal to kMaxColorPlanes.
<i>bufferPixelType</i>	Pixel type of image buffer (see dng_tag_types.h).
<i>allocator</i>	dng_memory_allocator to use for allocating temporary buffers, etc.

Reimplemented in [dng_opcode_FixVignetteRadial](#).

Referenced by [dng_inplace_opcode_task::Start\(\)](#).

6.58.2.3 `virtual void dng_inplace_opcode::ProcessArea (dng_negative & negative, uint32 threadIndex, dng_pixel_buffer & buffer, const dng_rect & dstArea, const dng_rect & imageBounds) [pure virtual]`

Implements image processing operation in a single buffer. The source pixels are provided as input to the buffer, and this routine calculates and writes the destination pixels to the same buffer. Ideally, no allocation should be done in this routine.

Parameters

<i>negative</i>	The negative associated with the pixels to be processed.
-----------------	--

<i>threadIndex</i>	The thread on which this routine is being called, between 0 and threadCount - 1 for the thread-Count passed to Prepare method.
<i>srcBuffer</i>	Input area and source pixels.
<i>dstBuffer</i>	Destination pixels.
<i>dstArea</i>	Destination pixel processing area.
<i>imageBounds</i>	Total image area to be processed; dstArea will always lie within these bounds.

Implemented in [dng_opcode_FixVignetteRadial](#), [dng_opcode_ScalePerColumn](#), [dng_opcode_ScalePerRow](#), [dng_opcode_DeltaPerColumn](#), [dng_opcode_DeltaPerRow](#), [dng_opcode_MapPolynomial](#), [dng_opcode_GainMap](#), and [dng_opcode_MapTable](#).

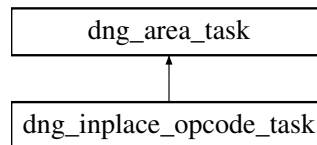

Referenced by `dng_inplace_opcode_task::Process()`.

The documentation for this class was generated from the following files:

- [dng_opcodes.h](#)
- [dng_opcodes.cpp](#)

6.59 dng_inplace_opcode_task Class Reference

Inheritance diagram for `dng_inplace_opcode_task`:

- virtual void **Start** (uint32 threadCount, const [dng_point](#) &tileSize, [dng_memory_allocator](#) *allocator, [dng_abort_sniffer](#) *)
- virtual void **Process** (uint32 threadIndex, const [dng_rect](#) &tile, [dng_abort_sniffer](#) *)

Additional Inherited Members

6.59.1 Member Function Documentation

6.59.1.1 virtual void `dng_inplace_opcode_task::Process (uint32 threadIndex, const dng_rect & tile, dng_abort_sniffer * sniffer)` `[inline]`, `[virtual]`

Process one tile or fully partitioned area. This method is overridden by derived classes to implement the actual image processing. Note that the sniffer can be ignored if it is certain that a processing task will complete very quickly. This method should never be called directly but rather accessed via `Process`. There is no allocator parameter as all allocation should be done in `Start`.

Parameters

<i>threadIndex</i>	0 to threadCount - 1 index indicating which thread this is. (Can be used to get a thread-specific buffer allocated in the <code>Start</code> method.)
<i>tile</i>	Area to process.
<i>sniffer</i>	dng_abort_sniffer to use to check for user cancellation and progress updates.

Implements [dng_area_task](#).

References [dng_image::Bounds\(\)](#), [dng_memory_block::Buffer\(\)](#), [dng_image::Get\(\)](#), [dng_image::Planes\(\)](#), [dng_inplace_opcode::ProcessArea\(\)](#), and [dng_image::Put\(\)](#).

6.59.1.2 virtual void [dng_inplace_opcode_task::Start](#) (uint32 *threadCount*, const [dng_point](#) & *tileSize*,
[dng_memory_allocator](#) * *allocator*, [dng_abort_sniffer](#) * *sniffer*) [inline],[virtual]

Task startup method called before any processing is done on partitions. The Start method is called before any processing is done and can be overridden to allocate temporary buffers, etc.

Parameters

<i>threadCount</i>	Total number of threads that will be used for processing. Less than or equal to MaxThreads.
<i>tileSize</i>	Size of source tiles which will be processed. (Not all tiles will be this size due to edge conditions.)
<i>allocator</i>	dng_memory_allocator to use for allocating temporary buffers, etc.
<i>sniffer</i>	Sniffer to test for user cancellation and to set up progress.

Reimplemented from [dng_area_task](#).

References [dng_memory_allocator::Allocate\(\)](#), [dng_image::Bounds\(\)](#), [dng_image::Planes\(\)](#), and [dng_inplace_opcode::Prepare\(\)](#).

6.60.1 Detailed Description

Class for reading and holding IPTC metadata associated with a DNG file.

See the [IPTC specification](#) for information on member fields of this class.

6.60.2 Member Function Documentation

6.60.2.1 bool dng_iptc::IsEmpty () const

Test if IPTC metadata exists.

Return values

<i>true</i>	if no IPTC metadata exists for this DNG.
-------------	--

References `NotEmpty()`.

Referenced by `NotEmpty()`.

6.60.2.2 bool dng_iptc::NotEmpty () const [inline]

Test if IPTC metadata exists.

Return values

<i>true</i>	if IPTC metadata exists for this DNG.
-------------	---------------------------------------

References IsEmpty().

Referenced by IsEmpty().

6.60.2.3 void dng_iptc::Parse (const void * *blockData*, uint32 *blockSize*, uint64 *offsetInOriginalFile*)

Parse a complete block of IPTC data.

Parameters

<i>blockData</i>	The block of IPTC data.
<i>blockSize</i>	Size in bytes of data block.
<i>offsetInOriginalFile</i>	Used to enable certain file patching operations such as updating date/time in place.

References dng_memory_data::Buffer_char(), dng_stream::Get(), dng_stream::Get_int8(), dng_stream::Get_uint16(), dng_stream::Get_uint8(), dng_stream::Length(), dng_stream::Position(), dng_stream::SetBigEndian(), and dng_stream::SetReadPosition().

6.60.2.4 dng_memory_block * dng_iptc::Spool (dng_memory_allocator & *allocator*, bool *padForTIFF*)

Serialize IPTC data to a memory block.

Parameters

<i>allocator</i>	Memory allocator used to acquire memory block.
<i>padForTIFF</i>	Forces length of block to be a multiple of four bytes in accordance with TIFF standard.

Return values

<i>Memory</i>	block
---------------	-------

References dng_stream::AsMemoryBlock(), DNG_ASSERT, dng_stream::Flush(), dng_stream::Length(), dng_stream::Put(), dng_stream::Put_uint16(), dng_stream::Put_uint8(), and dng_stream::SetBigEndian().

Process one tile or fully partitioned area. This method is overridden by derived classes to implement the actual image processing. Note that the sniffer can be ignored if it is certain that a processing task will complete very quickly. This method should never be called directly but rather accessed via [Process](#). There is no allocator parameter as all allocation should be done in [Start](#).

Parameters

<i>threadIndex</i>	0 to threadCount - 1 index indicating which thread this is. (Can be used to get a thread-specific buffer allocated in the Start method.)
<i>tile</i>	Area to process.
<i>sniffer</i>	dng_abort_sniffer to use to check for user cancellation and progress updates.

Implements [dng_area_task](#).

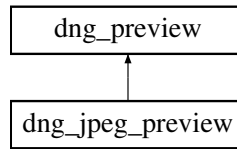

References [dng_md5_printer::Process\(\)](#), [dng_md5_printer::Result\(\)](#), and [dng_abort_sniffer::SniffForAbort\(\)](#).

Additional Inherited Members

6.66.1 Member Function Documentation

6.66.1.1 void [dng_limit_float_depth_task::Process](#) (uint32 *threadIndex*, const [dng_rect](#) & *tile*, [dng_abort_sniffer](#) * *sniffer*)
[virtual]

Process one tile or fully partitioned area. This method is overridden by derived classes to implement the actual image processing. Note that the sniffer can be ignored if it is certain that a processing task will complete very quickly. This method should never be called directly but rather accessed via [Process](#). There is no allocator parameter as all allocation should be done in [Start](#).

Parameters

<i>threadIndex</i>	0 to threadCount - 1 index indicating which thread this is. (Can be used to get a thread-specific buffer allocated in the Start method.)
<i>tile</i>	Area to process.
<i>sniffer</i>	dng_abort_sniffer to use to check for user cancellation and progress updates.

Implements [dng_area_task](#).

References [dng_pixel_buffer::ConstPixel\(\)](#), [dng_pixel_buffer::DirtyPixel\(\)](#), and [dng_image::Planes\(\)](#).

6.66.1.2 virtual [dng_rect](#) [dng_limit_float_depth_task::RepeatingTile1](#) () const [inline],[virtual]

Getter for [RepeatingTile1](#). [RepeatingTile1](#), [RepeatingTile2](#), and [RepeatingTile3](#) are used to establish a set of 0 to 3 tile patterns for which the resulting partitions that the final [Process](#) method is called on will not cross tile boundaries in any of the tile patterns. This can be used for a processing routine that needs to read from two tiles and write to a third such that all the tiles are aligned and sized in a certain way. A [RepeatingTile](#) value is valid if it is non-empty. Higher numbered [RepeatingTile](#) patterns are only used if all lower ones are non-empty. A [RepeatingTile](#) pattern must be a multiple of [UnitCell](#) in size for all constraints of the [partitionerr](#) to be met.

Reimplemented from [dng_area_task](#).

References [dng_image::RepeatingTile\(\)](#).

6.66.1.3 virtual dng_rect dng_limit_float_depth_task::RepeatingTile2 () const [inline],[virtual]

Getter for RepeatingTile2. RepeatingTile1, RepeatingTile2, and RepeatingTile3 are used to establish a set of 0 to 3 tile patterns for which the resulting partitions that the final Process method is called on will not cross tile boundaries in any of the tile patterns. This can be used for a processing routine that needs to read from two tiles and write to a third such that all the tiles are aligned and sized in a certain way. A RepeatingTile value is valid if it is non-empty. Higher numbered RepeatingTile patterns are only used if all lower ones are non-empty. A RepeatingTile pattern must be a multiple of UnitCell in size for all constraints of the partitionerr to be met.

Reimplemented from [dng_area_task](#).

References [dng_image::RepeatingTile\(\)](#).

- virtual void **Linearize** ([dng_host](#) &host, const [dng_image](#) &srcImage, [dng_image](#) &dstImage)
- [dng_urational](#) **BlackLevel** (uint32 row, uint32 col, uint32 plane) const
- uint32 **RowBlackCount** () const
Number of per-row black level deltas in fBlackDeltaV.
- [dng_srational](#) **RowBlack** (uint32 row) const
- uint32 **ColumnBlackCount** () const
Number of per-column black level deltas in fBlackDeltaV.
- [dng_srational](#) **ColumnBlack** (uint32 col) const

Public Attributes

- [dng_rect](#) fActiveArea
- uint32 fMaskedAreaCount
Number of rectangles in fMaskedArea.
- [dng_rect](#) fMaskedArea [kMaxMaskedAreas]
- [AutoPtr](#)< [dng_memory_block](#) > fLinearizationTable
- uint32 fBlackLevelRepeatRows
Actual number of rows in fBlackLevel pattern.
- uint32 fBlackLevelRepeatCols
Actual number of columns in fBlackLevel pattern.
- real64 fBlackLevel [kMaxBlackPattern][kMaxBlackPattern][kMaxSamplesPerPixel]
Repeating pattern of black level deltas fBlackLevelRepeatRows by fBlackLevelRepeatCols in size.

- [AutoPtr< dng_memory_block > fBlackDeltaH](#)
Memory block of double-precision floating point deltas between baseline black level and a given column's black level.
- [AutoPtr< dng_memory_block > fBlackDeltaV](#)
Memory block of double-precision floating point deltas between baseline black level and a given row's black level.
- `real64 fWhiteLevel [kMaxSamplesPerPixel]`
Single white level (maximum sensor value) for each sample plane.

Protected Attributes

- `int32 fBlackDenom`

6.67.1 Detailed Description

Class for managing data values related to DNG linearization.

See [LinearizationTable](#), [BlackLevel](#), [BlackLevelRepeatDim](#), [BlackLevelDeltaH](#), [BlackLevelDeltaV](#) and [WhiteLevel](#) tags in the [DNG 1.1.0 specification](#).

6.67.2 Member Function Documentation

6.67.2.1 `dng_urational dng_linearization_info::BlackLevel (uint32 row, uint32 col, uint32 plane) const`

Compute black level for one coordinate and sample plane in the image.

Parameters

<i>row</i>	Row to compute black level for.
<i>col</i>	Column to compute black level for.
<i>plane</i>	Sample plane to compute black level for.

References [fBlackLevel](#).

6.67.2.2 `dng_srational dng_linearization_info::ColumnBlack (uint32 col) const`

Lookup black level delta for a given column.

Parameters

<i>col</i>	Column to get black level for.
------------	--------------------------------

Return values

<i>black</i>	level for indicated column.
--------------	-----------------------------

References [dng_memory_block::Buffer_real64\(\)](#), [fBlackDeltaH](#), and [AutoPtr< T >::Get\(\)](#).

6.67.2.3 `void dng_linearization_info::Linearize (dng_host & host, const dng_image & srcImage, dng_image & dstImage) [virtual]`

Convert raw data from in-file format to a true linear image using linearization data from DNG.

Parameters

<i>host</i>	Used to allocate buffers, check for aborts, and post progress updates.
<i>srcImage</i>	Input pre-linearization RAW samples.
<i>dstImage</i>	Output linearized image.

References fActiveArea, and dng_host::PerformAreaTask().

6.67.2.4 real64 dng_linearization_info::MaxBlackLevel (uint32 plane) const

Compute the maximum black level for a given sample plane taking into account base black level, repeated black level patten, and row/column delta maps.

References dng_memory_block::Buffer_real64(), fBlackDeltaH, fBlackDeltaV, fBlackLevel, fBlackLevelRepeatCols, fBlackLevelRepeatRows, AutoPtr< T >::Get(), kMaxBlackPattern, and dng_memory_block::LogicalSize().

6.67.2.5 dng_srtional dng_linearization_info::RowBlack (uint32 row) const

Lookup black level delta for a given row.

Parameters

<i>row</i>	Row to get black level for.
------------	-----------------------------

Return values

<i>black</i>	level for indicated row.
--------------	--------------------------

References dng_memory_block::Buffer_real64(), fBlackDeltaV, and AutoPtr< T >::Get().

6.67.3 Member Data Documentation

6.67.3.1 dng_rect dng_linearization_info::fActiveArea

This rectangle defines the active (non-masked) pixels of the sensor. The order of the rectangle coordinates is: top, left, bottom, right.

Referenced by Linearize().

6.67.3.2 AutoPtr<dng_memory_block> dng_linearization_info::fLinearizationTable

A lookup table that maps stored values into linear values. This tag is typically used to increase compression ratios by storing the raw data in a non-linear, more visually uniform space with fewer total encoding levels. If SamplesPerPixel is not equal to one, e.g. Fuji S3 type sensor, this single table applies to all the samples for each pixel.

Referenced by dng_image_writer::WriteDNG().

6.67.3.3 dng_rect dng_linearization_info::fMaskedArea[kMaxMaskedAreas]

List of non-overlapping rectangle coordinates of fully masked pixels. Can be optionally used by DNG readers to measure the black encoding level. The order of each rectangle's coordinates is: top, left, bottom, right. If the raw image data has already had its black encoding level subtracted, then this tag should not be used, since the masked pixels are no longer useful. Note that DNG writers are still required to include an estimate and store the black encoding level using the black level DNG tags. Support for the MaskedAreas tag is not required of DNG readers.

Additional Inherited Members

6.68.1 Member Function Documentation

6.68.1.1 `void dng_linearize_image::Process (uint32 threadIndex, const dng_rect & tile, dng_abort_sniffer * sniffer)`
 [virtual]

Process one tile or fully partitioned area. This method is overridden by derived classes to implement the actual image processing. Note that the sniffer can be ignored if it is certain that a processing task will complete very quickly. This method should never be called directly but rather accessed via `Process`. There is no allocator parameter as all allocation should be done in `Start`.

Parameters

<i>threadIndex</i>	0 to threadCount - 1 index indicating which thread this is. (Can be used to get a thread-specific buffer allocated in the <code>Start</code> method.)
<i>tile</i>	Area to process.
<i>sniffer</i>	dng_abort_sniffer to use to check for user cancellation and progress updates.

Implements [dng_area_task](#).

References `dng_image::Planes()`.

6.68.1.2 `dng_rect dng_linearize_image::RepeatingTile1 () const` [virtual]

Getter for `RepeatingTile1`. `RepeatingTile1`, `RepeatingTile2`, and `RepeatingTile3` are used to establish a set of 0 to 3 tile patterns for which the resulting partitions that the final `Process` method is called on will not cross tile boundaries in any of the tile patterns. This can be used for a processing routine that needs to read from two tiles and write to a third such that all the tiles are aligned and sized in a certain way. A `RepeatingTile` value is valid if it is non-empty. Higher numbered `RepeatingTile` patterns are only used if all lower ones are non-empty. A `RepeatingTile` pattern must be a multiple of `UnitCell` in size for all constraints of the partitioner to be met.

Reimplemented from [dng_area_task](#).

References `dng_image::RepeatingTile()`.

6.68.1.3 `dng_rect dng_linearize_image::RepeatingTile2 () const [virtual]`

Getter for `RepeatingTile2`. `RepeatingTile1`, `RepeatingTile2`, and `RepeatingTile3` are used to establish a set of 0 to 3 tile patterns for which the resulting partitions that the final `Process` method is called on will not cross tile boundaries in any of the tile patterns. This can be used for a processing routine that needs to read from two tiles and write to a third such that all the tiles are aligned and sized in a certain way. A `RepeatingTile` value is valid if it is non-empty. Higher numbered `RepeatingTile` patterns are only used if all lower ones are non-empty. A `RepeatingTile` pattern must be a multiple of `UnitCell` in size for all constraints of the partitioner to be met.

6.80 dng_md5_printer Class Reference

Class to hash binary data to a fingerprint using the MD5 Message-Digest Algorithm.

```
#include <dng_fingerprint.h>
```

Inheritance diagram for dng_md5_printer:

Public Member Functions

- void [Reset](#) ()
Reset the fingerprint.
- void [Process](#) (const void *data, uint32 inputLen)
- void [Process](#) (const char *text)
- const [dng_fingerprint](#) & [Result](#) ()
Get the fingerprint (i.e., result of the hash).

6.80.1 Detailed Description

Class to hash binary data to a fingerprint using the MD5 Message-Digest Algorithm.

6.80.2 Member Function Documentation

6.80.2.1 void dng_md5_printer::Process (const void * data, uint32 inputLen)

Append the data to the stream to be hashed.

Parameters

<i>data</i>	The data to be hashed.
<i>inputLen</i>	The length of data, in bytes.

References [DNG_ASSERT](#).

Referenced by [Process\(\)](#), [dng_jpeg_image_find_digest_task::Process\(\)](#), [dng_find_new_raw_image_digest_task::Process\(\)](#), [dng_read_tiles_task::Process\(\)](#), [dng_read_image::Read\(\)](#), and [Result\(\)](#).

6.80.2.2 void dng_md5_printer::Process (const char * text) [inline]

Append the string to the stream to be hashed.

Parameters

<i>text</i>	The string to be hashed.
-------------	--------------------------

References [Process\(\)](#).

6.84.1 Detailed Description

Class to provide resource acquisition is instantiation discipline for small memory allocations.

Support for memory allocation. This class does not use [dng_memory_allocator](#) for memory allocation.

6.84.2 Constructor & Destructor Documentation

6.84.2.1 `dng_memory_data::dng_memory_data ()`

Construct an empty memory buffer using malloc.

Exceptions

<i>dng_memory_full</i>	with fErrorCode equal to <code>dng_error_memory</code> .
------------------------	--

6.84.2.2 `dng_memory_data::dng_memory_data (uint32 size)`

Construct memory buffer of size bytes using malloc.

Parameters

<i>size</i>	Number of bytes of memory needed.
-------------	-----------------------------------

Exceptions

<i>dng_memory_full</i>	with fErrorCode equal to <code>dng_error_memory</code> .
------------------------	--

References `Allocate()`.

6.84.3 Member Function Documentation

6.84.3.1 `void dng_memory_data::Allocate (uint32 size)`

Clear existing memory buffer and allocate new memory of size bytes.

Parameters

<i>size</i>	Number of bytes of memory needed.
-------------	-----------------------------------

Exceptions

<i>dng_memory_full</i>	with fErrorCode equal to <code>dng_error_memory</code> .
------------------------	--

References Clear(), and ThrowMemoryFull().

Referenced by dng_memory_data(), and dng_read_image::Read().

6.84.3.2 void* dng_memory_data::Buffer () [inline]

Return pointer to allocated memory as a void *..

Return values

<i>void</i>	* valid for as many bytes as were allocated.
-------------	--

Referenced by Buffer_char(), Buffer_int16(), Buffer_int32(), Buffer_int64(), Buffer_real32(), Buffer_real64(), Buffer_uint16(), Buffer_uint32(), Buffer_uint64(), Buffer_uint8(), dng_stream::CopyToStream(), and dng_stream::PutZeros().

6.84.3.3 const void* dng_memory_data::Buffer () const [inline]

Return pointer to allocated memory as a const void *.

Return values

<i>const</i>	void * valid for as many bytes as were allocated.
--------------	---

6.84.3.4 char* dng_memory_data::Buffer_char () [inline]

Return pointer to allocated memory as a char *.

Return values

<i>char</i>	* valid for as many bytes as were allocated.
-------------	--

References Buffer().

Referenced by dng_ipdc::Parse().

6.84.3.5 const char* dng_memory_data::Buffer_char () const [inline]

Return pointer to allocated memory as a const char *.

Return values

<i>const</i>	char * valid for as many bytes as were allocated.
--------------	---

References Buffer().

6.84.3.6 int16* dng_memory_data::Buffer_int16 () [inline]

Return pointer to allocated memory as a int16 *.

Return values

<i>int16</i>	* valid for as many bytes as were allocated.
--------------	--

References Buffer().

6.84.3.7 `const int16* dng_memory_data::Buffer_int16 () const [inline]`

Return pointer to allocated memory as a `const int16 *`.

Return values

<i>const</i>	int16 * valid for as many bytes as were allocated.
--------------	--

References Buffer().

6.84.3.8 `int32* dng_memory_data::Buffer_int32 () [inline]`

Return pointer to allocated memory as a `const int32 *`.

Return values

<i>const</i>	int32 * valid for as many bytes as were allocated.
--------------	--

References Buffer().

6.84.3.9 `const int32* dng_memory_data::Buffer_int32 () const [inline]`

Return pointer to allocated memory as a `const int32 *`.

Return values

<i>const</i>	int32 * valid for as many bytes as were allocated.
--------------	--

References Buffer().

6.84.3.10 `int64* dng_memory_data::Buffer_int64 () [inline]`

Return pointer to allocated memory as a `const int64 *`.

Return values

<i>const</i>	int64 * valid for as many bytes as were allocated.
--------------	--

References Buffer().

6.84.3.11 `const int64* dng_memory_data::Buffer_int64 () const [inline]`

Return pointer to allocated memory as a `const int64 *`.

Return values

<i>const</i>	int64 * valid for as many bytes as were allocated.
--------------	--

References Buffer().

6.84.3.12 `real32* dng_memory_data::Buffer_real32 () [inline]`

Return pointer to allocated memory as a `real32 *`.

Return values

<i>real32</i>	* valid for as many bytes as were allocated.
---------------	--

References Buffer().

6.84.3.13 `const real32* dng_memory_data::Buffer_real32 () const [inline]`

Return pointer to allocated memory as a const real32 *.

Return values

<i>const</i>	real32 * valid for as many bytes as were allocated.
--------------	---

References Buffer().

6.84.3.14 `real64* dng_memory_data::Buffer_real64 () [inline]`

Return pointer to allocated memory as a real64 *.

Return values

<i>real64</i>	* valid for as many bytes as were allocated.
---------------	--

References Buffer().

6.84.3.15 `const real64* dng_memory_data::Buffer_real64 () const [inline]`

Return pointer to allocated memory as a const real64 *.

Return values

<i>const</i>	real64 * valid for as many bytes as were allocated.
--------------	---

References Buffer().

6.84.3.16 `uint16* dng_memory_data::Buffer_uint16 () [inline]`

Return pointer to allocated memory as a uint16 *.

Return values

<i>uint16</i>	* valid for as many bytes as were allocated.
---------------	--

References Buffer().

6.84.3.17 `const uint16* dng_memory_data::Buffer_uint16 () const [inline]`

Return pointer to allocated memory as a const uint16 *.

Return values

<i>const</i>	uint16 * valid for as many bytes as were allocated.
--------------	---

References Buffer().

6.84.3.18 `uint32* dng_memory_data::Buffer_uint32 () [inline]`

Return pointer to allocated memory as a uint32 *.

Return values

<i>uint32</i>	* valid for as many bytes as were allocated.
---------------	--

References Buffer().

Referenced by dng_read_image::Read(), and dng_image_writer::WriteDNG().

6.84.3.19 `const uint32* dng_memory_data::Buffer_uint32 () const [inline]`

Return pointer to allocated memory as a uint32 *.

Return values

<i>uint32</i>	* valid for as many bytes as were allocated.
---------------	--

References Buffer().

6.84.3.20 `uint64* dng_memory_data::Buffer_uint64 () [inline]`

Return pointer to allocated memory as a uint64 *.

Return values

<i>uint64</i>	* valid for as many bytes as were allocated.
---------------	--

References Buffer().

Referenced by dng_read_image::Read().

6.84.3.21 `const uint64* dng_memory_data::Buffer_uint64 () const [inline]`

Return pointer to allocated memory as a uint64 *.

Return values

<i>uint64</i>	* valid for as many bytes as were allocated.
---------------	--

References Buffer().

6.84.3.22 `uint8* dng_memory_data::Buffer_uint8 () [inline]`

Return pointer to allocated memory as a uint8 *.

Return values

<i>uint8</i>	* valid for as many bytes as were allocated.
--------------	--

References Buffer().

6.84.3.23 `const uint8* dng_memory_data::Buffer_uint8 () const [inline]`

Return pointer to allocated memory as a const uint8 *.

Return values

<i>const</i>	uint8 * valid for as many bytes as were allocated.
--------------	--

References Buffer().

6.84.3.24 void dng_memory_data::Clear ()

Release any allocated memory using free. Object is still valid and Allocate can be called again.

Referenced by Allocate(), and ~dng_memory_data().

The documentation for this class was generated from the following files:

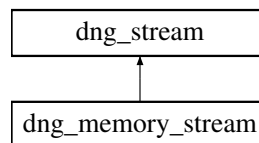

- dng_memory.h
- dng_memory.cpp

6.85 dng_memory_stream Class Reference

A [dng_stream](#) which can be read from or written to memory.

```
#include <dng_memory_stream.h>
```

Inheritance diagram for dng_memory_stream:

Public Member Functions

- [dng_memory_block](#) ** **fPageList**
- uint64 **fMemoryStreamLength**

Additional Inherited Members

6.85.1 Detailed Description

A [dng_stream](#) which can be read from or written to memory.

Stream is populated via writing and either read or accessed by asking for contents as a pointer.

6.85.2 Constructor & Destructor Documentation

6.85.2.1 `dng_memory_stream::dng_memory_stream (dng_memory_allocator & allocator, dng_abort_sniffer * sniffer = NULL, uint32 pageSize = 64 * 1024)`

Construct a new memory-based stream.

Parameters

<i>allocator</i>	Allocator to use to allocate memory in stream as needed.
<i>sniffer</i>	If non-NULL used to check for user cancellation.
<i>pageSize</i>	Unit of allocation for data stored in stream.

6.85.3 Member Function Documentation

6.85.3.1 `void dng_memory_stream::CopyToStream (dng_stream & dstStream, uint64 count) [virtual]`

Copy a specified number of bytes to a target stream.

Parameters

<i>dstStream</i>	The target stream.
<i>count</i>	The number of bytes to copy.

Reimplemented from [dng_stream](#).

References `dng_memory_block::Buffer_uint8()`, `dng_stream::Flush()`, `dng_stream::Length()`, `dng_stream::Position()`, `dng_stream::Put()`, `dng_stream::SetReadPosition()`, and `ThrowEndOfFile()`.

6.87.1 Detailed Description

Support for describing color filter array patterns and manipulating mosaic sample data.

See CFAPattern tag in [TIFF/EP specification](#) and CFAPlaneColor, CFALayout, and BayerGreenSplit tags in the [DNG 1.1.0 specification](#).

6.87.2 Member Function Documentation

6.87.2.1 `dng_point dng_mosaic_info::DownScale (uint32 minSize, uint32 prefSize, real64 cropFactor) const` [virtual]

Returns integer factors by which mosaic data must be downsampled to produce an image which is as close to prefSize as possible in longer dimension, but no smaller than minSize.

Parameters

<i>minSize</i>	Number of pixels as minium for longer dimension of downsampled image.
<i>prefSize</i>	Number of pixels as target for longer dimension of downsampled image.
<i>cropFactor</i>	Faction of the image to be used after cropping.

Return values

<i>Point</i>	containing integer factors by which image must be downsampled.
--------------	--

References IsColorFilterArray().

6.87.2.2 `dng_point dng_mosaic_info::DstSize (const dng_point & downScale) const` [virtual]

Return size of demosaiced image for passed in downscaling factor.

Parameters

<i>downScale</i>	Integer downsampling factor obtained from DownScale method.
------------------	---

Return values

<i>Size</i>	of resulting demosaiced image.
-------------	--------------------------------

References FullScale().

6.87.2.3 dng_point dng_mosaic_info::FullScale () const [virtual]

Returns scaling factor relative to input size needed to capture output data. Staggered (or rotated) sensing arrays are produced to a larger output than the number of input samples. This method indicates how much larger.

Return values

<i>a</i>	point with integer scaling factors for the horizontal and vertical dimensions.
----------	--

References fCFALayout.

Referenced by DstSize(), and InterpolateGeneric().

6.87.2.4 void dng_mosaic_info::Interpolate (dng_host & host, dng_negative & negative, const dng_image & srcImage, dng_image & dstImage, const dng_point & downScale, uint32 srcPlane = 0) const [virtual]

Demosaic interpolation of a single plane. Chooses between generic and fast interpolators based on parameters.

Parameters

<i>host</i>	dng_host to use for buffer allocation requests, user cancellation testing, and progress updates.
<i>negative</i>	DNG negative of mosaiced data.
<i>srcImage</i>	Source image for mosaiced data.
<i>dstImage</i>	Destination image for resulting interpolated data.
<i>downScale</i>	Amount (in horizontal and vertical) by which to subsample image.
<i>srcPlane</i>	Which plane to interpolate.

References InterpolateFast(), and InterpolateGeneric().

6.87.2.5 void dng_mosaic_info::InterpolateFast (dng_host & host, dng_negative & negative, const dng_image & srcImage, dng_image & dstImage, const dng_point & downScale, uint32 srcPlane = 0) const [virtual]

Demosaic interpolation of a single plane for downsampled case.

Parameters

<i>host</i>	dng_host to use for buffer allocation requests, user cancellation testing, and progress updates.
<i>negative</i>	DNG negative of mosaiced data.
<i>srcImage</i>	Source image for mosaiced data.
<i>dstImage</i>	Destination image for resulting interpolated data.
<i>downScale</i>	Amount (in horizontal and vertical) by which to subsample image.
<i>srcPlane</i>	Which plane to interpolate.

References dng_image::Bounds(), and dng_host::PerformAreaTask().

Referenced by Interpolate().

6.87.2.6 void dng_mosaic_info::InterpolateGeneric (dng_host & host, dng_negative & negative, const dng_image & srcImage, dng_image & dstImage, uint32 srcPlane = 0) const [virtual]

Demosaic interpolation of a single plane for non-downsampled case.

Parameters

<i>host</i>	dng_host to use for buffer allocation requests, user cancellation testing, and progress updates.
<i>negative</i>	DNG negative of mosaiced data.
<i>srcImage</i>	Source image for mosaiced data.

<i>dstImage</i>	Destination image for resulting interpolated data.
<i>srcPlane</i>	Which plane to interpolate.

References `dng_host::Allocate()`, `dng_image::Bounds()`, `dng_image::edge_repeat`, `fCFAPatternSize`, `fColorPlanes`, `FullScale()`, `dng_image::Get()`, `dng_image::PixelSize()`, `dng_image::PixelType()`, `dng_image::Put()`, `dng_image::RepeatingTile()`, and `dng_host::SniffForAbort()`.

Referenced by `Interpolate()`.

6.87.2.7 `bool dng_mosaic_info::IsColorFilterArray () const [inline]`

Returns whether the RAW data in this DNG file from a color filter array (mosaiced) source.

Return values

<i>true</i>	if this DNG file is from a color filter array (mosaiced) source.
-------------	--

References `fCFAPatternSize`.

Referenced by `DownScale()`, and `dng_image_writer::WriteDNG()`.

6.87.2.8 `bool dng_mosaic_info::SetFourColorBayer () [virtual]`

Enable generating four-plane output from three-plane Bayer input. Extra plane is a second version of the green channel. First green is produced using green mosaic samples from one set of rows/columns (even/odd) and the second green channel is produced using the other set of rows/columns. One can compare the two versions to judge whether `BayerGreenSplit` needs to be set for a given input source.

References `fCFAPattern`, `fCFAPatternSize`, and `fColorPlanes`.

6.87.3 Member Data Documentation

6.87.3.1 `uint32 dng_mosaic_info::fBayerGreenSplit`

Value of `BayerGreenSplit` tag in DNG file. `BayerGreenSplit` only applies to CFA images using a Bayer pattern filter array. This tag specifies, in arbitrary units, how closely the values of the green pixels in the blue/green rows track the values of the green pixels in the red/green rows.

A value of zero means the two kinds of green pixels track closely, while a non-zero value means they sometimes diverge. The useful range for this tag is from 0 (no divergence) to about 5000 (large divergence).

6.87.3.2 `uint32 dng_mosaic_info::fCFALayout`

Value of `CFALayout` tag in the [DNG 1.3 specification](#). `CFALayout` describes the spatial layout of the CFA. The currently defined values are:

- 1 = Rectangular (or square) layout.
- 2 = Staggered layout A: even columns are offset down by 1/2 row.
- 3 = Staggered layout B: even columns are offset up by 1/2 row.
- 4 = Staggered layout C: even rows are offset right by 1/2 column.
- 5 = Staggered layout D: even rows are offset left by 1/2 column.
- 6 = Staggered layout E: even rows are offset up by 1/2 row, even columns are offset left by 1/2 column.

- 7 = Staggered layout F: even rows are offset up by 1/2 row, even columns are offset right by 1/2 column.
- 8 = Staggered layout G: even rows are offset down by 1/2 row, even columns are offset left by 1/2 column.
- 9 = Staggered layout H: even rows are offset down by 1/2 row, even columns are offset right by 1/2 column.

Referenced by FullScale(), and dng_image_writer::WriteDNG().

6.89 dng_negative Class Reference

Main class for holding DNG image data and associated metadata.

```
#include <dng_negative.h>
```

Public Types

- enum **RawImageStageEnum** {
rawImageStagePreOpcode1, **rawImageStagePostOpcode1**, **rawImageStagePostOpcode2**, **rawImageStagePreOpcode3**,
rawImageStagePostOpcode3, **rawImageStageNone** }

Public Member Functions

- [dng_memory_allocator](#) & **Allocator** () const
Provide access to the memory allocator used for this object.
- void [SetModelName](#) (const char *name)
Getter for ModelName.
- const [dng_string](#) & **ModelName** () const

- Setter for ModelName.*

 - void [SetLocalName](#) (const char *name)
- Setter for LocalName.*

 - const [dng_string](#) & [LocalName](#) () const
- Getter for LocalName.*

 - [dng_metadata](#) & [Metadata](#) ()
- Getter for metadata.*

 - [dng_metadata](#) * [CloneInternalMetadata](#) () const
- void [SetBaseOrientation](#) (const [dng_orientation](#) &orientation)
- Setter for BaseOrientation.*

 - bool [HasBaseOrientation](#) () METACONST
- Has BaseOrientation been set?*

 - const [dng_orientation](#) & [BaseOrientation](#) () METACONST
- Getter for BaseOrientation.*

 - virtual [dng_orientation](#) [ComputeOrientation](#) (const [dng_metadata](#) &metadata) const
- Hook to allow SDK host code to add additional rotations.*

 - [dng_orientation](#) [Orientation](#) ()
- For non-const negatives, we simply default to using the metadata attached to the negative.*

 - void [ApplyOrientation](#) (const [dng_orientation](#) &orientation)
- void [SetDefaultCropSize](#) (const [dng_urational](#) &sizeH, const [dng_urational](#) &sizeV)
- Setter for DefaultCropSize.*

 - void [SetDefaultCropSize](#) (uint32 sizeH, uint32 sizeV)
- Setter for DefaultCropSize.*

 - const [dng_urational](#) & [DefaultCropSizeH](#) () const
- Getter for DefaultCropSize horizontal.*

 - const [dng_urational](#) & [DefaultCropSizeV](#) () const
- Getter for DefaultCropSize vertical.*

 - void [SetDefaultCropOrigin](#) (const [dng_urational](#) &originH, const [dng_urational](#) &originV)
- Setter for DefaultCropOrigin.*

 - void [SetDefaultCropOrigin](#) (uint32 originH, uint32 originV)
- Setter for DefaultCropOrigin.*

 - void [SetDefaultCropCentered](#) (const [dng_point](#) &rawSize)
- Set default crop around center of image.*

 - const [dng_urational](#) & [DefaultCropOriginH](#) () const
- Get default crop origin horizontal value.*

 - const [dng_urational](#) & [DefaultCropOriginV](#) () const
- Get default crop origin vertical value.*

 - const [dng_urational](#) & [DefaultUserCropT](#) () const
- Getter for top coordinate of default user crop.*

 - const [dng_urational](#) & [DefaultUserCropL](#) () const
- Getter for left coordinate of default user crop.*

 - const [dng_urational](#) & [DefaultUserCropB](#) () const
- Getter for bottom coordinate of default user crop.*

 - const [dng_urational](#) & [DefaultUserCropR](#) () const
- Getter for right coordinate of default user crop.*

 - void [ResetDefaultUserCrop](#) ()
- Reset default user crop to default crop area.*

- void [SetDefaultUserCrop](#) (const [dng_urational](#) &t, const [dng_urational](#) &l, const [dng_urational](#) &b, const [dng_urational](#) &r)
Setter for all 4 coordinates of default user crop.
- void [SetDefaultUserCropT](#) (const [dng_urational](#) &value)
Setter for top coordinate of default user crop.
- void [SetDefaultUserCropL](#) (const [dng_urational](#) &value)
Setter for left coordinate of default user crop.
- void [SetDefaultUserCropB](#) (const [dng_urational](#) &value)
Setter for bottom coordinate of default user crop.
- void [SetDefaultUserCropR](#) (const [dng_urational](#) &value)
Setter for right coordinate of default user crop.
- void [SetDefaultScale](#) (const [dng_urational](#) &scaleH, const [dng_urational](#) &scaleV)
Setter for DefaultScale.
- const [dng_urational](#) & [DefaultScaleH](#) () const
Get default scale horizontal value.
- const [dng_urational](#) & [DefaultScaleV](#) () const
Get default scale vertical value.
- void [SetBestQualityScale](#) (const [dng_urational](#) &scale)
Setter for BestQualityScale.
- const [dng_urational](#) & [BestQualityScale](#) () const
Getter for BestQualityScale.
- real64 [RawToFullScaleH](#) () const
API for raw to full image scaling factors horizontal.
- real64 [RawToFullScaleV](#) () const
API for raw to full image scaling factors vertical.
- void [SetRawToFullScale](#) (real64 scaleH, real64 scaleV)
Setter for raw to full scales.
- real64 [DefaultScale](#) () const
- real64 [SquareWidth](#) () const
Default cropped image size (at scale == 1.0) width.
- real64 [SquareHeight](#) () const
Default cropped image size (at scale == 1.0) height.
- real64 [AspectRatio](#) () const
Default cropped image aspect ratio.
- real64 [PixelAspectRatio](#) () const
Pixel aspect ratio of stage 3 image.
- uint32 [FinalWidth](#) (real64 scale) const
Default cropped image size at given scale factor width.
- uint32 [FinalHeight](#) (real64 scale) const
Default cropped image size at given scale factor height.
- uint32 [DefaultFinalWidth](#) () const
Default cropped image size at default scale factor width.
- uint32 [DefaultFinalHeight](#) () const
Default cropped image size at default scale factor height.
- uint32 [BestQualityFinalWidth](#) () const
- uint32 [BestQualityFinalHeight](#) () const
- const [dng_point](#) & [OriginalDefaultFinalSize](#) () const

- void [SetOriginalDefaultFinalSize](#) (const [dng_point](#) &size)
Setter for OriginalDefaultFinalSize.
- const [dng_point](#) & [OriginalBestQualityFinalSize](#) () const
- void [SetOriginalBestQualityFinalSize](#) (const [dng_point](#) &size)
Setter for OriginalBestQualityFinalSize.
- const [dng_urational](#) & [OriginalDefaultCropSizeH](#) () const
- const [dng_urational](#) & [OriginalDefaultCropSizeV](#) () const
- void [SetOriginalDefaultCropSize](#) (const [dng_urational](#) &sizeH, const [dng_urational](#) &sizeV)
Setter for OriginalDefaultCropSize.
- void [SetDefaultOriginalSizes](#) ()
- [dng_rect](#) [DefaultCropArea](#) () const
The default crop area in the stage 3 image coordinates.
- void [SetBaselineNoise](#) (real64 noise)
Setter for BaselineNoise.
- const [dng_urational](#) & [BaselineNoiseR](#) () const
Getter for BaselineNoise as dng_urational.
- real64 [BaselineNoise](#) () const
Getter for BaselineNoise as real64.
- void [SetNoiseReductionApplied](#) (const [dng_urational](#) &value)
Setter for NoiseReductionApplied.
- const [dng_urational](#) & [NoiseReductionApplied](#) () const
Getter for NoiseReductionApplied.
- void [SetNoiseProfile](#) (const [dng_noise_profile](#) &noiseProfile)
Setter for noise profile.
- bool [HasNoiseProfile](#) () const
Does this negative have a valid noise profile?
- const [dng_noise_profile](#) & [NoiseProfile](#) () const
Getter for noise profile.
- void [SetBaselineExposure](#) (real64 exposure)
Setter for BaselineExposure.
- const [dng_srational](#) & [BaselineExposureR](#) () const
Getter for BaselineExposure as dng_urational.
- real64 [BaselineExposure](#) () const
Getter for BaselineExposure as real64.
- real64 [TotalBaselineExposure](#) (const [dng_camera_profile_id](#) &profileID) const
- void [SetBaselineSharpness](#) (real64 sharpness)
Setter for BaselineSharpness.
- const [dng_urational](#) & [BaselineSharpnessR](#) () const
Getter for BaselineSharpness as dng_urational.
- real64 [BaselineSharpness](#) () const
Getter for BaselineSharpness as real64.
- void [SetChromaBlurRadius](#) (const [dng_urational](#) &radius)
Setter for ChromaBlurRadius.
- const [dng_urational](#) & [ChromaBlurRadius](#) () const
Getter for ChromaBlurRadius as dng_urational.
- void [SetAntiAliasStrength](#) (const [dng_urational](#) &strength)
Setter for AntiAliasStrength.

- const [dng_urational](#) & [AntiAliasStrength](#) () const
Getter for AntiAliasStrength as [dng_urational](#).
- void [SetLinearResponseLimit](#) (real64 limit)
Setter for LinearResponseLimit.
- const [dng_urational](#) & [LinearResponseLimitR](#) () const
Getter for LinearResponseLimit as [dng_urational](#).
- real64 [LinearResponseLimit](#) () const
Getter for LinearResponseLimit as real64.
- void [SetShadowScale](#) (const [dng_urational](#) &scale)
Setter for ShadowScale.
- const [dng_urational](#) & [ShadowScaleR](#) () const
Getter for ShadowScale as [dng_urational](#).
- real64 [ShadowScale](#) () const
Getter for ShadowScale as real64.
- void **SetColorimetricReference** (uint32 ref)
- uint32 **ColorimetricReference** () const
- void [SetColorChannels](#) (uint32 channels)
Setter for ColorChannels.
- uint32 [ColorChannels](#) () const
Getter for ColorChannels.
- void [SetMonochrome](#) ()
Setter for Monochrome.
- bool [IsMonochrome](#) () const
Getter for Monochrome.
- void [SetAnalogBalance](#) (const [dng_vector](#) &b)
Setter for AnalogBalance.
- [dng_urational](#) [AnalogBalanceR](#) (uint32 channel) const
Getter for AnalogBalance as [dng_urational](#).
- real64 [AnalogBalance](#) (uint32 channel) const
Getter for AnalogBalance as real64.
- void [SetCameraNeutral](#) (const [dng_vector](#) &n)
Setter for CameraNeutral.
- void [ClearCameraNeutral](#) ()
Clear CameraNeutral.
- bool [HasCameraNeutral](#) () const
Determine if CameraNeutral has been set but not cleared.
- const [dng_vector](#) & [CameraNeutral](#) () const
Getter for CameraNeutral.
- [dng_urational](#) **CameraNeutralR** (uint32 channel) const
- void [SetCameraWhiteXY](#) (const [dng_xy_coord](#) &coord)
Setter for CameraWhiteXY.
- bool **HasCameraWhiteXY** () const
- const [dng_xy_coord](#) & **CameraWhiteXY** () const
- void **GetCameraWhiteXY** ([dng_urational](#) &x, [dng_urational](#) &y) const
- void [SetCameraCalibration1](#) (const [dng_matrix](#) &m)
- void [SetCameraCalibration2](#) (const [dng_matrix](#) &m)
- const [dng_matrix](#) & [CameraCalibration1](#) () const

Getter for first of up to two color matrices used for individual camera calibrations.

- const [dng_matrix](#) & **CameraCalibration2** () const

Getter for second of up to two color matrices used for individual camera calibrations.

- void **SetCameraCalibrationSignature** (const char *signature)

6.89.1 Detailed Description

Main class for holding DNG image data and associated metadata.

6.89.2 Member Function Documentation

6.89.2.1 void dng_negative::ApplyOrientation (const [dng_orientation](#) & *orientation*) [inline]

Logically rotates the image by changing the orientation values. This will also update the XMP data.

References [dng_metadata::ApplyOrientation\(\)](#), and [Metadata\(\)](#).

6.89.2.2 `uint32 dng_negative::BestQualityFinalHeight () const [inline]`

Get best quality height. For a naive conversion, one could use either the default size, or the best quality size.

References `BestQualityScale()`, `DefaultScale()`, and `FinalHeight()`.

Referenced by `SetDefaultOriginalSizes()`, and `dng_image_writer::WriteDNG()`.

6.89.2.3 `uint32 dng_negative::BestQualityFinalWidth () const [inline]`

Get best quality width. For a naive conversion, one could use either the default size, or the best quality size.

References `BestQualityScale()`, `DefaultScale()`, and `FinalWidth()`.

Referenced by `SetDefaultOriginalSizes()`, and `dng_image_writer::WriteDNG()`.

6.89.2.4 `dng_metadata * dng_negative::CloneInternalMetadata () const`

Make a copy of the internal metadata generally as a basis for further changes.

References `Allocator()`, `dng_metadata::Clone()`, and `InternalMetadata()`.

6.89.2.5 `real64 dng_negative::DefaultScale () const [inline]`

Get default scale factor. When specifying a single scale factor, we use the horizontal scale factor, and let the vertical scale factor be calculated based on the pixel aspect ratio.

References `DefaultScaleH()`.

Referenced by `BestQualityFinalHeight()`, `BestQualityFinalWidth()`, `DefaultFinalHeight()`, and `DefaultFinalWidth()`.

6.89.2.6 `const dng_metadata& dng_negative::InternalMetadata () const [inline], [protected]`

An accessor for the internal metadata that works even when we have general access turned off. This is needed to provide access to EXIF ISO information.

Referenced by `CloneInternalMetadata()`.

6.89.2.7 `const dng_point& dng_negative::OriginalBestQualityFinalSize () const [inline]`

Best quality size of original (non-proxy) image. For non-proxy images, this is equal to `BestQualityFinalWidth/BestQualityFinalHeight`. For proxy images, this is equal to the `BestQualityFinalWidth/BestQualityFinalHeight` of the image this proxy was derived from.

Referenced by `SetDefaultOriginalSizes()`, and `dng_image_writer::WriteDNG()`.

6.89.2.8 `const dng_urational& dng_negative::OriginalDefaultCropSizeH () const [inline]`

`DefaultCropSize` for original (non-proxy) image. For non-proxy images, this is equal to the `DefaultCropSize`. for proxy images, this is equal size of the `DefaultCropSize` of the image this proxy was derived from.

Referenced by `SetDefaultOriginalSizes()`, and `dng_image_writer::WriteDNG()`.

6.89.2.9 `const dng_point& dng_negative::OriginalDefaultFinalSize () const [inline]`

Default size of original (non-proxy) image. For non-proxy images, this is equal to `DefaultFinalWidth/DefaultFinalHeight`. For proxy images, this is equal to the `DefaultFinalWidth/DefaultFinalHeight` of the image this proxy was derived from.

Referenced by `SetDefaultOriginalSizes()`, and `dng_image_writer::WriteDNG()`.

6.89.2.10 void dng_negative::SetCameraCalibration1 (const dng_matrix & m)

Setter for first of up to two color matrices used for individual camera calibrations.

The sequence of matrix transforms is: Camera data → camera calibration → "inverse" of color matrix

This will be a 4x4 matrix for a four-color camera. The defaults are almost always the identity matrix, and for the cases where they aren't, they are diagonal matrices.

6.89.2.11 void dng_negative::SetCameraCalibration2 (const dng_matrix & m)

Setter for second of up to two color matrices used for individual camera calibrations.

The sequence of matrix transforms is: Camera data → camera calibration → "inverse" of color matrix

This will be a 4x4 matrix for a four-color camera. The defaults are almost always the identity matrix, and for the cases where they aren't, they are diagonal matrices.

6.89.2.12 void dng_negative::SetDefaultOriginalSizes ()

If the original size fields are undefined, set them to the current sizes.

References BestQualityFinalHeight(), BestQualityFinalWidth(), DefaultCropSizeH(), DefaultCropSizeV(), DefaultFinalHeight(), DefaultFinalWidth(), OriginalBestQualityFinalSize(), OriginalDefaultCropSizeH(), OriginalDefaultFinalSize(), SetOriginalBestQualityFinalSize(), SetOriginalDefaultCropSize(), and SetOriginalDefaultFinalSize().

6.89.2.13 real64 dng_negative::TotalBaselineExposure (const dng_camera_profile_id & profileID) const

Compute total baseline exposure (sum of negative's BaselineExposure and profile's BaselineExposureOffset).

References BaselineExposure(), and dng_camera_profile::BaselineExposureOffset().

Referenced by dng_render_task::Start().

The documentation for this class was generated from the following files:

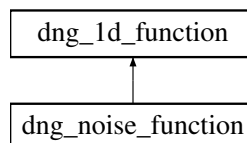

- [dng_negative.h](#)
- [dng_negative.cpp](#)

6.90 dng_noise_function Class Reference

Noise model for photon and sensor read noise, assuming that they are independent random variables and spatially invariant.

```
#include <dng_negative.h>
```

Inheritance diagram for dng_noise_function:

Public Member Functions

- [dng_noise_function \(\)](#)
Create empty and invalid noise function.

- [dng_noise_function](#) (real64 scale, real64 offset)
Create noise function with the specified scale and offset.
- virtual real64 [Evaluate](#) (real64 x) const
- real64 [Scale](#) () const
The scale (slope, gain) of the noise function.
- real64 [Offset](#) () const
The offset (square of the noise floor) of the noise function.
- void [SetScale](#) (real64 scale)
Set the scale (slope, gain) of the noise function.
- void [SetOffset](#) (real64 offset)
Set the offset (square of the noise floor) of the noise function.
- bool [IsValid](#) () const
Is the noise function valid?

Protected Attributes

- real64 **fScale**
- real64 **fOffset**

6.90.1 Detailed Description

Noise model for photon and sensor read noise, assuming that they are independent random variables and spatially invariant.

The noise model is $N(x) = \sqrt{\text{scale} * x + \text{offset}}$, where x represents a linear signal value in the range $[0,1]$, and $N(x)$ is the standard deviation (i.e., noise). The parameters `scale` and `offset` are both sensor-dependent and ISO-dependent. `scale` must be positive, and `offset` must be non-negative.

6.90.2 Member Function Documentation

6.90.2.1 virtual real64 `dng_noise_function::Evaluate (real64 x) const` `[inline]`, `[virtual]`

Compute noise (standard deviation) at the specified average signal level x .

Implements [dng_1d_function](#).

The documentation for this class was generated from the following file:

- [dng_negative.h](#)

6.91 dng_noise_profile Class Reference

Noise profile for a negative.

```
#include <dng_negative.h>
```

Public Member Functions

- [dng_noise_profile](#) ()
Create empty (invalid) noise profile.

- [dng_noise_profile](#) (const std::vector< [dng_noise_function](#) > &functions)
Create noise profile with the specified noise functions (1 per plane).
- bool [IsValid](#) () const
Is the noise profile valid?
- bool [IsValidForNegative](#) (const [dng_negative](#) &negative) const
Is the noise profile valid for the specified negative?
- const [dng_noise_function](#) & [NoiseFunction](#) (uint32 plane) const
The noise function for the specified plane.
- uint32 [NumFunctions](#) () const
The number of noise functions in this profile.

Protected Attributes

- std::vector< [dng_noise_function](#) > **fNoiseFunctions**

6.91.1 Detailed Description

Noise profile for a negative.

For mosaiced negatives, the noise profile describes the approximate noise characteristics of a mosaic negative after linearization, but prior to demosaicing. For demosaiced negatives (i.e., linear DNGs), the noise profile describes the approximate noise characteristics of the image data immediately following the demosaic step, prior to the processing of opcode list 3.

A noise profile may contain 1 or N noise functions, where N is the number of color planes for the negative. Otherwise the noise profile is considered to be invalid for that negative. If the noise profile contains 1 noise function, then it is assumed that this single noise function applies to all color planes of the negative. Otherwise, the N noise functions map to the N planes of the negative in order specified in the CFAPlaneColor tag.

The documentation for this class was generated from the following files:

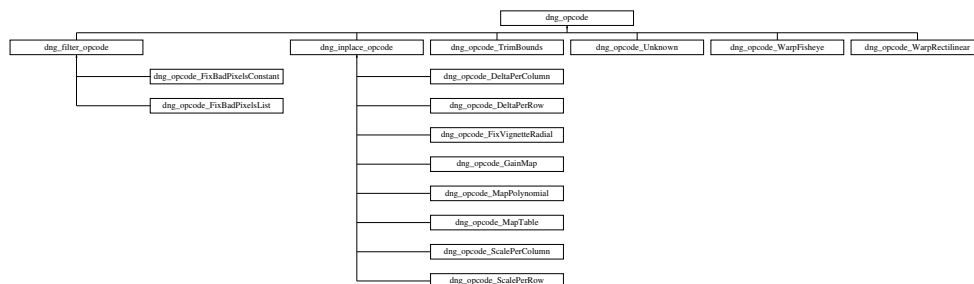

- [dng_negative.h](#)
- [dng_negative.cpp](#)

6.92 dng_opcode Class Reference

Virtual base class for opcode.

```
#include <dng_opcodes.h>
```

Inheritance diagram for dng_opcode:

Public Types

- enum { `kFlag_None` = 0, `kFlag_Optional` = 1, `kFlag_SkipIfPreview` = 2 }
Opcode flags.

Public Member Functions

- uint32 `OpcodeID` () const
The ID of this opcode.
- uint32 `MinVersion` () const
The first DNG version that supports this opcode.
- uint32 `Flags` () const
The flags for this opcode.
- bool `Optional` () const
Is this opcode optional?
- bool `SkipIfPreview` () const
Should the opcode be skipped when rendering preview images?
- bool `WasReadFromStream` () const
Was this opcode read from a data stream?
- uint32 `Stage` () const
- void `SetStage` (uint32 stage)
- virtual bool `IsNOP` () const
- virtual bool `IsValidForNegative` (const `dng_negative` &) const
Is this opcode valid for the specified negative?
- virtual void `PutData` (`dng_stream` &stream) const
- bool `AboutToApply` (`dng_host` &host, `dng_negative` &negative)
- virtual void `Apply` (`dng_host` &host, `dng_negative` &negative, `AutoPtr`< `dng_image` > &image)=0
Apply this opcode to the specified image with associated negative.

Protected Member Functions

- `dng_opcode` (uint32 opcodeID, uint32 minVersion, uint32 flags)
- `dng_opcode` (uint32 opcodeID, `dng_stream` &stream, const char *name)

6.92.1 Detailed Description

Virtual base class for opcode.

6.92.2 Member Enumeration Documentation

6.92.2.1 anonymous enum

Opcode flags.

Enumerator:

- `kFlag_None`** No flag.
- `kFlag_Optional`** This opcode is optional.
- `kFlag_SkipIfPreview`** May skip opcode for preview images.

6.92.3 Member Function Documentation

6.92.3.1 bool dng_opcode::AboutToApply (dng_host & *host*, dng_negative & *negative*)

Perform error checking prior to applying this opcode to the specified negative. Returns true if this opcode should be applied to the negative, false otherwise.

References [dng_host::ForPreview\(\)](#), [IsNOP\(\)](#), [IsValidForNegative\(\)](#), [MinVersion\(\)](#), [Optional\(\)](#), [SkipIfPreview\(\)](#), [ThrowBadFormat\(\)](#), and [WasReadFromStream\(\)](#).

Referenced by [dng_opcode_list::Apply\(\)](#).

6.92.3.2 virtual bool dng_opcode::IsNOP () const [inline],[virtual]

Is the opcode a NOP (i.e., does nothing)? An opcode could be a NOP for some specific parameters.

Reimplemented in [dng_opcode_FixVignetteRadial](#), [dng_opcode_WarpFisheye](#), and [dng_opcode_WarpRectilinear](#).

Referenced by [AboutToApply\(\)](#).

6.92.3.3 void dng_opcode::PutData (dng_stream & *stream*) const [virtual]

Write opcode to a stream.

Parameters

<i>stream</i>	The stream to which to write the opcode data.
---------------	---

Reimplemented in [dng_opcode_FixVignetteRadial](#), [dng_opcode_WarpFisheye](#), [dng_opcode_WarpRectilinear](#), [dng_opcode_ScalePerColumn](#), [dng_opcode_ScalePerRow](#), [dng_opcode_DeltaPerColumn](#), [dng_opcode_DeltaPerRow](#), [dng_opcode_FixBadPixelsList](#), [dng_opcode_Unknown](#), [dng_opcode_MapPolynomial](#), [dng_opcode_GainMap](#), [dng_opcode_MapTable](#), [dng_opcode_FixBadPixelsConstant](#), and [dng_opcode_TrimBounds](#).

References [dng_stream::Put_uint32\(\)](#).

6.92.3.4 void dng_opcode::SetStage (uint32 *stage*) [inline]

Set the image processing stage (1, 2, 3) for this opcode. Stage 1 is the original image data, including masked areas. Stage 2 is linearized image data and trimmed to the active area. Stage 3 is demosaiced and trimmed to the active area.

Referenced by [dng_opcode_list::Append\(\)](#).

6.92.3.5 uint32 dng_opcode::Stage () const [inline]

Which image processing stage (1, 2, 3) is associated with this opcode?

Referenced by [dng_opcode_MapPolynomial::BufferPixelType\(\)](#).

The documentation for this class was generated from the following files:

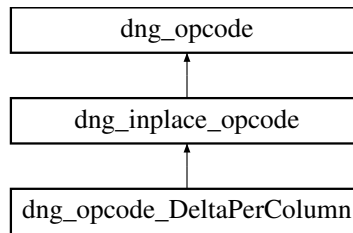

- [dng_opcodes.h](#)
- [dng_opcodes.cpp](#)

6.93 dng_opcode_DeltaPerColumn Class Reference

An opcode to apply a delta (i.e., offset) that varies per column. Within a column, the same delta value is applied to all specified pixels.

```
#include <dng_misc_opcodes.h>
```

Inheritance diagram for dng_opcode_DeltaPerColumn:

Public Member Functions

- [dng_opcode_DeltaPerColumn](#) (const [dng_area_spec](#) &areaSpec, [AutoPtr](#)< [dng_memory_block](#) > &table)
- **dng_opcode_DeltaPerColumn** ([dng_host](#) &host, [dng_stream](#) &stream)
- virtual void [PutData](#) ([dng_stream](#) &stream) const
- virtual uint32 [BufferPixelType](#) (uint32 imagePixelType)
The pixel data type of this opcode.
- virtual [dng_rect ModifiedBounds](#) (const [dng_rect](#) &imageBounds)
- virtual void [ProcessArea](#) ([dng_negative](#) &negative, uint32 threadIndex, [dng_pixel_buffer](#) &buffer, const [dng_rect](#) &dstArea, const [dng_rect](#) &imageBounds)

Additional Inherited Members

6.93.1 Detailed Description

An opcode to apply a delta (i.e., offset) that varies per column. Within a column, the same delta value is applied to all specified pixels.

6.93.2 Constructor & Destructor Documentation

6.93.2.1 `dng_opcode_DeltaPerColumn::dng_opcode_DeltaPerColumn (const dng_area_spec & areaSpec, AutoPtr< dng_memory_block > & table)`

Create a DeltaPerColumn opcode with the specified area and column deltas (specified as a table of 32-bit floats).

References [AutoPtr< T >::Release\(\)](#), and [AutoPtr< T >::Reset\(\)](#).

6.93.3 Member Function Documentation

6.93.3.1 `dng_rect dng_opcode_DeltaPerColumn::ModifiedBounds (const dng_rect & imageBounds) [virtual]`

The adjusted bounds (processing area) of this opcode. It is limited to the intersection of the specified image area and the GainMap area.

Reimplemented from [dng_inplace_opcode](#).

References [dng_area_spec::Overlap\(\)](#).

6.93.3.2 `void dng_opcode_DeltaPerColumn::ProcessArea (dng_negative & negative, uint32 threadIndex, dng_pixel_buffer & buffer, const dng_rect & dstArea, const dng_rect & imageBounds)` [virtual]

Implements image processing operation in a single buffer. The source pixels are provided as input to the buffer, and this routine calculates and writes the destination pixels to the same buffer. Ideally, no allocation should be done in this routine.

Parameters

<i>negative</i>	The negative associated with the pixels to be processed.
<i>threadIndex</i>	The thread on which this routine is being called, between 0 and threadCount - 1 for the threadCount passed to Prepare method.
<i>srcBuffer</i>	Input area and source pixels.
<i>dstBuffer</i>	Destination pixels.
<i>dstArea</i>	Destination pixel processing area.
<i>imageBounds</i>	Total image area to be processed; <i>dstArea</i> will always lie within these bounds.

Implements [dng_inplace_opcode](#).

References [dng_area_spec::Area\(\)](#), [dng_memory_block::Buffer_real32\(\)](#), [dng_area_spec::ColPitch\(\)](#), [dng_pixel_buffer::DirtyPixel_real32\(\)](#), [dng_area_spec::Overlap\(\)](#), [dng_area_spec::Plane\(\)](#), [dng_area_spec::Planes\(\)](#), [dng_pixel_buffer::Planes\(\)](#), [dng_area_spec::RowPitch\(\)](#), and [dng_pixel_buffer::RowStep\(\)](#).

6.93.3.3 `void dng_opcode_DeltaPerColumn::PutData (dng_stream & stream) const` [virtual]

Write opcode to a stream.

Parameters

<i>stream</i>	The stream to which to write the opcode data.
---------------	---

Reimplemented from [dng_opcode](#).

References [dng_area_spec::Area\(\)](#), [dng_memory_block::Buffer_real32\(\)](#), [dng_area_spec::ColPitch\(\)](#), [dng_stream::Put_real32\(\)](#), [dng_stream::Put_uint32\(\)](#), and [dng_area_spec::PutData\(\)](#).

The documentation for this class was generated from the following files:

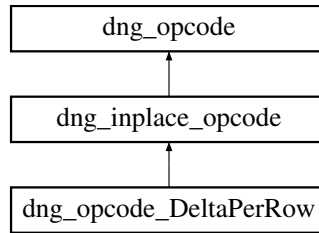

- [dng_misc_opcodes.h](#)
- [dng_misc_opcodes.cpp](#)

6.94 dng_opcode_DeltaPerRow Class Reference

An opcode to apply a delta (i.e., offset) that varies per row. Within a row, the same delta value is applied to all specified pixels.

```
#include <dng_misc_opcodes.h>
```

Inheritance diagram for `dng_opcode_DeltaPerRow`:

Public Member Functions

- [dng_opcode_DeltaPerRow](#) (const [dng_area_spec](#) &areaSpec, [AutoPtr](#)< [dng_memory_block](#) > &table)
- **dng_opcode_DeltaPerRow** ([dng_host](#) &host, [dng_stream](#) &stream)
- virtual void [PutData](#) ([dng_stream](#) &stream) const
- virtual uint32 [BufferPixelType](#) (uint32 imagePixelType)
The pixel data type of this opcode.
- virtual [dng_rect](#) [ModifiedBounds](#) (const [dng_rect](#) &imageBounds)
- virtual void [ProcessArea](#) ([dng_negative](#) &negative, uint32 threadIndex, [dng_pixel_buffer](#) &buffer, const [dng_rect](#) &dstArea, const [dng_rect](#) &imageBounds)

Additional Inherited Members

6.94.1 Detailed Description

An opcode to apply a delta (i.e., offset) that varies per row. Within a row, the same delta value is applied to all specified pixels.

6.94.2 Constructor & Destructor Documentation

6.94.2.1 `dng_opcode_DeltaPerRow::dng_opcode_DeltaPerRow (const dng_area_spec & areaSpec, AutoPtr< dng_memory_block > & table)`

Create a DeltaPerRow opcode with the specified area and row deltas (specified as a table of 32-bit floats).

References [AutoPtr](#)< T >::Release(), and [AutoPtr](#)< T >::Reset().

6.94.3 Member Function Documentation

6.94.3.1 `dng_rect dng_opcode_DeltaPerRow::ModifiedBounds (const dng_rect & imageBounds)` [virtual]

The adjusted bounds (processing area) of this opcode. It is limited to the intersection of the specified image area and the GainMap area.

Reimplemented from [dng_inplace_opcode](#).

References [dng_area_spec::Overlap](#)().

6.94.3.2 `void dng_opcode_DeltaPerRow::ProcessArea (dng_negative & negative, uint32 threadIndex, dng_pixel_buffer & buffer, const dng_rect & dstArea, const dng_rect & imageBounds)` [virtual]

Implements image processing operation in a single buffer. The source pixels are provided as input to the buffer, and this routine calculates and writes the destination pixels to the same buffer. Ideally, no allocation should be done in this routine.

Parameters

<i>negative</i>	The negative associated with the pixels to be processed.
<i>threadIndex</i>	The thread on which this routine is being called, between 0 and threadCount - 1 for the threadCount passed to Prepare method.
<i>srcBuffer</i>	Input area and source pixels.
<i>dstBuffer</i>	Destination pixels.
<i>dstArea</i>	Destination pixel processing area.
<i>imageBounds</i>	Total image area to be processed; dstArea will always lie within these bounds.

Implements [dng_inplace_opcode](#).

References [dng_area_spec::Area\(\)](#), [dng_memory_block::Buffer_real32\(\)](#), [dng_area_spec::ColPitch\(\)](#), [dng_pixel_buffer::DirtyPixel_real32\(\)](#), [dng_area_spec::Overlap\(\)](#), [dng_area_spec::Plane\(\)](#), [dng_area_spec::Planes\(\)](#), [dng_pixel_buffer::Planes\(\)](#), and [dng_area_spec::RowPitch\(\)](#).

6.94.3.3 void [dng_opcode_DeltaPerRow::PutData](#) ([dng_stream & stream](#)) const [virtual]

Write opcode to a stream.

Parameters

<i>stream</i>	The stream to which to write the opcode data.
---------------	---

Reimplemented from [dng_opcode](#).

References [dng_area_spec::Area\(\)](#), [dng_memory_block::Buffer_real32\(\)](#), [dng_stream::Put_real32\(\)](#), [dng_stream::Put_uint32\(\)](#), [dng_area_spec::PutData\(\)](#), and [dng_area_spec::RowPitch\(\)](#).

6.95.1 Detailed Description

An opcode to fix individual bad pixels that are marked with a constant value (e.g., 0) in a Bayer image.

6.95.2 Constructor & Destructor Documentation

6.95.2.1 dng_opcode_FixBadPixelsConstant::dng_opcode_FixBadPixelsConstant (uint32 *constant*, uint32 *bayerPhase*)

Construct an opcode to fix an individual bad pixels that are marked with a constant value in a Bayer image.

Parameters

<i>constant</i>	The constant value that indicates a bad pixel.
<i>bayerPhase</i>	The phase of the Bayer mosaic pattern (0, 1, 2, 3).

6.95.3 Member Function Documentation

6.95.3.1 void dng_opcode_FixBadPixelsConstant::Prepare ([dng_negative](#) & , uint32 , const [dng_point](#) & , const [dng_rect](#) & , uint32 , uint32 , [dng_memory_allocator](#) &) [virtual]

Startup method called before any processing is performed on pixel areas. It can be used to allocate (per-thread) memory and setup tasks.

Parameters

<i>negative</i>	The negative object to be processed.
<i>threadCount</i>	The number of threads to be used to perform the processing.
<i>threadCount</i>	Total number of threads that will be used for processing. Less than or equal to MaxThreads.
<i>tileSize</i>	Size of source tiles which will be processed. (Not all tiles will be this size due to edge conditions.)
<i>imageBounds</i>	Total size of image to be processed.
<i>imagePlanes</i>	Number of planes in the image. Less than or equal to kMaxColorPlanes.
<i>bufferPixelType</i>	Pixel type of image buffer (see dng_tag_types.h).
<i>allocator</i>	dng_memory_allocator to use for allocating temporary buffers, etc.

Reimplemented from [dng_filter_opcode](#).

References [ThrowBadFormat\(\)](#).

6.95.3.2 void dng_opcode_FixBadPixelsConstant::ProcessArea (dng_negative & *negative*, uint32 *threadIndex*, dng_pixel_buffer & *srcBuffer*, dng_pixel_buffer & *dstBuffer*, const dng_rect & *dstArea*, const dng_rect & *imageBounds*) [virtual]

Implements filtering operation from one buffer to another. Source and destination pixels are set up in member fields of this class. Ideally, no allocation should be done in this routine.

Parameters

<i>negative</i>	The negative associated with the pixels to be processed.
<i>threadIndex</i>	The thread on which this routine is being called, between 0 and threadCount - 1 for the threadCount passed to Prepare method.
<i>srcBuffer</i>	Input area and source pixels.
<i>dstBuffer</i>	Destination pixels.
<i>dstArea</i>	Destination pixel processing area.
<i>imageBounds</i>	Total image area to be processed; <i>dstArea</i> will always lie within these bounds.

Implements [dng_filter_opcode](#).

References dng_pixel_buffer::ConstPixel_uint16(), dng_pixel_buffer::CopyArea(), and dng_pixel_buffer::DirtyPixel_uint16().

6.95.3.3 void dng_opcode_FixBadPixelsConstant::PutData (dng_stream & *stream*) const [virtual]

Write opcode to a stream.

Parameters

<i>stream</i>	The stream to which to write the opcode data.
---------------	---

Reimplemented from [dng_opcode](#).

References dng_stream::Put_uint32().

6.95.3.4 dng_rect dng_opcode_FixBadPixelsConstant::SrcArea (const dng_rect & *dstArea*, const dng_rect &) [virtual]

Returns the source pixel area needed to process a destination pixel area that lies within the specified bounds.

Parameters

<i>dstArea</i>	The destination pixel area to be computed.
<i>imageBounds</i>	The overall image area (<i>dstArea</i> will lie within these bounds).

Return values

<i>The</i>	source pixel area needed to process the specified <i>dstArea</i> .
------------	--

Reimplemented from [dng_filter_opcode](#).

The documentation for this class was generated from the following files:

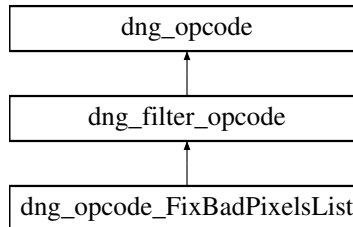

- [dng_bad_pixels.h](#)
- [dng_bad_pixels.cpp](#)

6.96 dng_opcode_FixBadPixelsList Class Reference

An opcode to fix lists of bad pixels (indicated by position) in a Bayer image.

```
#include <dng_bad_pixels.h>
```

Inheritance diagram for dng_opcode_FixBadPixelsList:

Public Member Functions

6.96.1 Detailed Description

An opcode to fix lists of bad pixels (indicated by position) in a Bayer image.

6.96.2 Constructor & Destructor Documentation

6.96.2.1 dng_opcode_FixBadPixelsList::dng_opcode_FixBadPixelsList ([AutoPtr< dng_bad_pixel_list >](#) & *list*, [uint32](#) *bayerPhase*)

Construct an opcode to fix lists of bad pixels (indicated by position) in a Bayer image.

Parameters

<i>list</i>	The list of bad pixels to fix.
<i>bayerPhase</i>	The phase of the Bayer mosaic pattern (0, 1, 2, 3).

References [AutoPtr< T >::Release\(\)](#).

6.96.3 Member Function Documentation

6.96.3.1 void dng_opcode_FixBadPixelsList::Prepare ([dng_negative](#) &, [uint32](#), [const dng_point](#) &, [const dng_rect](#) &, [uint32](#), [uint32](#), [dng_memory_allocator](#) &) [[virtual](#)]

Startup method called before any processing is performed on pixel areas. It can be used to allocate (per-thread) memory and setup tasks.

Parameters

<i>negative</i>	The negative object to be processed.
<i>threadCount</i>	The number of threads to be used to perform the processing.
<i>threadCount</i>	Total number of threads that will be used for processing. Less than or equal to MaxThreads .
<i>tileSize</i>	Size of source tiles which will be processed. (Not all tiles will be this size due to edge conditions.)
<i>imageBounds</i>	Total size of image to be processed.
<i>imagePlanes</i>	Number of planes in the image. Less than or equal to kMaxColorPlanes .
<i>bufferPixelFormat</i>	Pixel type of image buffer (see dng_tag_types.h).
<i>allocator</i>	dng_memory_allocator to use for allocating temporary buffers, etc.

Reimplemented from [dng_filter_opcode](#).

References [ThrowBadFormat\(\)](#).

6.96.3.2 void dng_opcode_FixBadPixelsList::ProcessArea ([dng_negative](#) & *negative*, [uint32](#) *threadIndex*, [dng_pixel_buffer](#) & *srcBuffer*, [dng_pixel_buffer](#) & *dstBuffer*, [const dng_rect](#) & *dstArea*, [const dng_rect](#) & *imageBounds*) [[virtual](#)]

Implements filtering operation from one buffer to another. Source and destination pixels are set up in member fields of this class. Ideally, no allocation should be done in this routine.

Parameters

<i>negative</i>	The negative associated with the pixels to be processed.
<i>threadIndex</i>	The thread on which this routine is being called, between 0 and <i>threadCount</i> - 1 for the <i>threadCount</i> passed to <i>Prepare</i> method.
<i>srcBuffer</i>	Input area and source pixels.
<i>dstBuffer</i>	Destination pixels.
<i>dstArea</i>	Destination pixel processing area.
<i>imageBounds</i>	Total image area to be processed; <i>dstArea</i> will always lie within these bounds.

Implements [dng_filter_opcode](#).

References `dng_pixel_buffer::CopyArea()`, `dng_bad_pixel_list::IsPointIsolated()`, `dng_bad_pixel_list::IsRectIsolated()`, `dng_bad_pixel_list::Point()`, `dng_bad_pixel_list::PointCount()`, `dng_bad_pixel_list::Rect()`, `dng_bad_pixel_list::RectCount()`, `dng_pixel_buffer::RepeatSubArea()`, and `SrcRepeat()`.

6.96.3.3 `void dng_opcode_FixBadPixelsList::PutData (dng_stream & stream) const` `[virtual]`

Write opcode to a stream.

Parameters

<i>stream</i>	The stream to which to write the opcode data.
---------------	---

Reimplemented from [dng_opcode](#).

References `dng_bad_pixel_list::Point()`, `dng_bad_pixel_list::PointCount()`, `dng_stream::Put_int32()`, `dng_stream::Put_uint32()`, `dng_bad_pixel_list::Rect()`, and `dng_bad_pixel_list::RectCount()`.

6.96.3.4 `dng_rect dng_opcode_FixBadPixelsList::SrcArea (const dng_rect & dstArea, const dng_rect &)` `[virtual]`

Returns the source pixel area needed to process a destination pixel area that lies within the specified bounds.

Parameters

<i>dstArea</i>	The destination pixel area to be computed.
<i>imageBounds</i>	The overall image area (dstArea will lie within these bounds).

Return values

<i>The</i>	source pixel area needed to process the specified dstArea.
------------	--

Reimplemented from [dng_filter_opcode](#).

References `dng_bad_pixel_list::PointCount()`, and `dng_bad_pixel_list::RectCount()`.

6.97.1 Detailed Description

Radially-symmetric lens vignette correction opcode.

6.97.2 Member Function Documentation

6.97.2.1 bool dng_opcode_FixVignetteRadial::IsNOP () const [virtual]

Is the opcode a NOP (i.e., does nothing)? An opcode could be a NOP for some specific parameters.

Reimplemented from [dng_opcode](#).

6.97.2.2 `void dng_opcode_FixVignetteRadial::Prepare (dng_negative &, uint32, const dng_point &, const dng_rect &, uint32, uint32, dng_memory_allocator &) [virtual]`

Startup method called before any processing is performed on pixel areas. It can be used to allocate (per-thread) memory and setup tasks.

Parameters

<i>negative</i>	The negative object to be processed.
<i>threadCount</i>	The number of threads to be used to perform the processing.
<i>threadCount</i>	Total number of threads that will be used for processing. Less than or equal to MaxThreads.
<i>tileSize</i>	Size of source tiles which will be processed. (Not all tiles will be this size due to edge conditions.)
<i>imageBounds</i>	Total size of image to be processed.
<i>imagePlanes</i>	Number of planes in the image. Less than or equal to kMaxColorPlanes.
<i>bufferPixelType</i>	Pixel type of image buffer (see dng_tag_types.h).
<i>allocator</i>	dng_memory_allocator to use for allocating temporary buffers, etc.

Reimplemented from [dng_inplace_opcode](#).

References [dng_memory_allocator::Allocate\(\)](#), [dng_memory_block::Buffer_uint16\(\)](#), [DNG_ASSERT](#), [dng_1d_table::Initialize\(\)](#), [dng_1d_table::Interpolate\(\)](#), [kMaxColorPlanes](#), [dng_negative::PixelAspectRatio\(\)](#), [AutoPtr< T >::Reset\(\)](#), [ThrowBadFormat\(\)](#), and [ThrowProgramError\(\)](#).

6.97.2.3 `void dng_opcode_FixVignetteRadial::ProcessArea (dng_negative & negative, uint32 threadIndex, dng_pixel_buffer & buffer, const dng_rect & dstArea, const dng_rect & imageBounds) [virtual]`

Implements image processing operation in a single buffer. The source pixels are provided as input to the buffer, and this routine calculates and writes the destination pixels to the same buffer. Ideally, no allocation should be done in this routine.

Parameters

<i>negative</i>	The negative associated with the pixels to be processed.
<i>threadIndex</i>	The thread on which this routine is being called, between 0 and threadCount - 1 for the threadCount passed to Prepare method.
<i>srcBuffer</i>	Input area and source pixels.
<i>dstBuffer</i>	Destination pixels.
<i>dstArea</i>	Destination pixel processing area.
<i>imageBounds</i>	Total image area to be processed; dstArea will always lie within these bounds.

Implements [dng_inplace_opcode](#).

References [dng_memory_block::Buffer\(\)](#), [dng_memory_block::Buffer_uint16\(\)](#), [dng_pixel_buffer::ConstPixel_uint16\(\)](#), [dng_pixel_buffer::DirtyPixel_real32\(\)](#), [dng_pixel_buffer::DirtyPixel_uint16\(\)](#), [dng_pixel_buffer::PlaneStep\(\)](#), and [dng_pixel_buffer::RowStep\(\)](#).

6.97.2.4 `void dng_opcode_FixVignetteRadial::PutData (dng_stream & stream) const [virtual]`

Write opcode to a stream.

Parameters

<i>stream</i>	The stream to which to write the opcode data.
---------------	---

Reimplemented from [dng_opcode](#).

References [DNG_REQUIRE](#), [dng_stream::Put_real64\(\)](#), and [dng_stream::Put_uint32\(\)](#).

The documentation for this class was generated from the following files:

- [dng_opcode_GainMap](#) ([dng_host](#) &host, [dng_stream](#) &stream)
Construct a GainMap opcode from the specified stream.
- virtual void [PutData](#) ([dng_stream](#) &stream) const
Write the opcode to the specified stream.
- virtual uint32 [BufferPixelType](#) (uint32)
The pixel data type of this opcode.
- virtual [dng_rect ModifiedBounds](#) (const [dng_rect](#) &imageBounds)
- virtual void [ProcessArea](#) ([dng_negative](#) &negative, uint32 threadIndex, [dng_pixel_buffer](#) &buffer, const [dng_rect](#) &dstArea, const [dng_rect](#) &imageBounds)
Apply the gain map.

Additional Inherited Members

6.98.1 Detailed Description

An opcode to fix 2D spatially-varying light falloff or color casts (i.e., uniformity issues). This is commonly due to shading.

6.98.2 Constructor & Destructor Documentation

6.98.2.1 `dng_opcode_GainMap::dng_opcode_GainMap (const dng_area_spec & areaSpec, AutoPtr< dng_gain_map > & gainMap)`

Construct a GainMap opcode for the specified image area and the specified gain map.

References [AutoPtr](#)< T >::Release(), and [AutoPtr](#)< T >::Reset().

6.98.3 Member Function Documentation

6.98.3.1 `virtual dng_rect dng_opcode::GainMap::ModifiedBounds (const dng_rect & imageBounds) [inline], [virtual]`

The adjusted bounds (processing area) of this opcode. It is limited to the intersection of the specified image area and the GainMap area.

Reimplemented from [dng_inplace_opcode](#).

References `dng_area_spec::Overlap()`.

The documentation for this class was generated from the following files:

- [dng_gain_map.h](#)
- [dng_gain_map.cpp](#)

6.99 dng_opcode_list Class Reference

A list of opcodes.

```
#include <dng_opcode_list.h>
```

Public Member Functions

- [dng_opcode_list](#) (uint32 stage)
Create an empty opcode list for the specific image stage (1, 2, or 3).
- bool [IsEmpty](#) () const
Is the opcode list empty?
- bool [NotEmpty](#) () const
Does the list contain at least 1 opcode?
- bool [AlwaysApply](#) () const
Should the opcode list always be applied to the image?
- void [SetAlwaysApply](#) ()
- uint32 [Count](#) () const
The number of opcodes in this list.
- [dng_opcode & Entry](#) (uint32 index)
- const [dng_opcode & Entry](#) (uint32 index) const
- void [Clear](#) ()
Remove all opcodes from the list.
- void [Swap](#) ([dng_opcode_list](#) &otherList)
Swap two opcode lists.
- uint32 [MinVersion](#) (bool includeOptional) const
- void [Apply](#) ([dng_host](#) &host, [dng_negative](#) &negative, [AutoPtr](#)< [dng_image](#) > &image)
- void [Append](#) ([AutoPtr](#)< [dng_opcode](#) > &opcode)
Append the specified opcode to this list.
- [dng_memory_block](#) * [Spool](#) ([dng_host](#) &host) const
- void [FingerprintToStream](#) ([dng_stream](#) &stream) const
Write a fingerprint of this opcode list to the specified stream.
- void [Parse](#) ([dng_host](#) &host, [dng_stream](#) &stream, uint32 byteCount, uint64 streamOffset)

6.99.1 Detailed Description

A list of opcodes.

6.99.2 Member Function Documentation

6.99.2.1 void dng_opcode_list::Apply (dng_host & host, dng_negative & negative, AutoPtr< dng_image > & image)

Apply this opcode list to the specified image with corresponding negative.

References dng_opcode::AboutToApply(), dng_opcode::Apply(), Count(), and Entry().

Referenced by dng_host::ApplyOpcodeList().

6.99.2.2 dng_opcode& dng_opcode_list::Entry (uint32 index) [inline]

Retrieve read/write opcode by index (must be in the range 0 to Count () - 1).

Referenced by Apply().

6.99.2.3 const dng_opcode& dng_opcode_list::Entry (uint32 index) const [inline]

Retrieve read-only opcode by index (must be in the range 0 to Count () - 1).

6.99.2.4 uint32 dng_opcode_list::MinVersion (bool includeOptional) const

Return minimum DNG version required to support all opcodes in this list. If includeOptional is set to true, then this calculation will include optional opcodes.

Referenced by FingerprintToStream(), Spool(), and dng_image_writer::WriteDNG().

6.99.2.5 void dng_opcode_list::Parse (dng_host & host, dng_stream & stream, uint32 byteCount, uint64 streamOffset)

Read an opcode list from the specified stream, starting at the specified offset (streamOffset, in bytes). byteCount is provided for error checking purposes. A bad format exception will be thrown if the length of the opcode stream does not exactly match byteCount.

References Append(), Clear(), dng_stream::Get_uint32(), dng_host::Make_dng_opcode(), dng_stream::Position(), dng_stream::SetReadPosition(), and ThrowBadFormat().

6.99.2.6 void dng_opcode_list::SetAlwaysApply () [inline]

Set internal flag to indicate this opcode list should always be applied.

Referenced by Append().

6.99.2.7 dng_memory_block * dng_opcode_list::Spool (dng_host & host) const

Serialize this opcode list to a block of memory. The caller is responsible for deleting this block.

References dng_host::Allocator(), AlwaysApply(), IsEmpty(), MinVersion(), dng_stream::SetBigEndian(), and ThrowProgramError().

Referenced by dng_image_writer::WriteDNG().

The documentation for this class was generated from the following files:

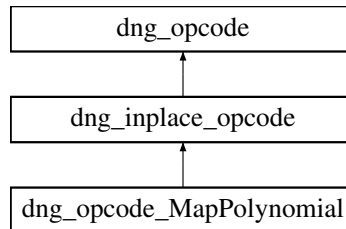

- [dng_opcode_list.h](#)
- [dng_opcode_list.cpp](#)

6.100 dng_opcode_MapPolynomial Class Reference

An opcode to apply a 1D function (represented as a polynomial) to an image area.

```
#include <dng_misc_opcodes.h>
```

Inheritance diagram for dng_opcode_MapPolynomial:

Public Types

- enum { **kMaxDegree** = 8 }

Public Member Functions

6.100.1 Detailed Description

An opcode to apply a 1D function (represented as a polynomial) to an image area.

6.100.2 Constructor & Destructor Documentation

6.100.2.1 **dng_opcode_MapPolynomial::dng_opcode_MapPolynomial** (const [dng_area_spec](#) & *areaSpec*, uint32 *degree*, const real64 * *coefficient*)

Create a MapPolynomial opcode with the specified area, polynomial degree, and polynomial coefficients. The function that will be applied to each pixel x is:

$$f(x) = \text{coefficient}[0] + (x * \text{coefficient}[1]) + (x^2 * \text{coefficient}[2]) + (x^3 * \text{coefficient}[3]) + (x^4 * \text{coefficient}[4]) \dots$$

6.100.3 Member Function Documentation

6.100.3.1 dng_rect dng_opcode_MapPolynomial::ModifiedBounds (const dng_rect & *imageBounds*) [virtual]

The adjusted bounds (processing area) of this opcode. It is limited to the intersection of the specified image area and the GainMap area.

Reimplemented from [dng_inplace_opcode](#).

References `dng_area_spec::Overlap()`.

6.100.3.2 void dng_opcode_MapPolynomial::ProcessArea (dng_negative & *negative*, uint32 *threadIndex*, dng_pixel_buffer & *buffer*, const dng_rect & *dstArea*, const dng_rect & *imageBounds*) [virtual]

Implements image processing operation in a single buffer. The source pixels are provided as input to the buffer, and this routine calculates and writes the destination pixels to the same buffer. Ideally, no allocation should be done in this routine.

Parameters

<i>negative</i>	The negative associated with the pixels to be processed.
<i>threadIndex</i>	The thread on which this routine is being called, between 0 and threadCount - 1 for the threadCount passed to Prepare method.
<i>srcBuffer</i>	Input area and source pixels.
<i>dstBuffer</i>	Destination pixels.
<i>dstArea</i>	Destination pixel processing area.
<i>imageBounds</i>	Total image area to be processed; <i>dstArea</i> will always lie within these bounds.

Implements [dng_inplace_opcode](#).

References `dng_area_spec::ColPitch()`, `dng_pixel_buffer::DirtyPixel_real32()`, `dng_area_spec::Overlap()`, `dng_area_spec::Plane()`, `dng_area_spec::Planes()`, `dng_pixel_buffer::Planes()`, and `dng_area_spec::RowPitch()`.

6.100.3.3 void dng_opcode_MapPolynomial::PutData (dng_stream & *stream*) const [virtual]

Write opcode to a stream.

Parameters

<i>stream</i>	The stream to which to write the opcode data.
---------------	---

Reimplemented from [dng_opcode](#).

References `dng_stream::Put_real64()`, `dng_stream::Put_uint32()`, and `dng_area_spec::PutData()`.

The documentation for this class was generated from the following files:

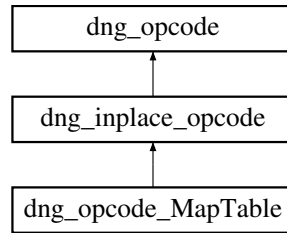

- [dng_misc_opcodes.h](#)
- [dng_misc_opcodes.cpp](#)

6.101 dng_opcode_MapTable Class Reference

An opcode to apply a 1D function (represented as a 16-bit table) to an image area.

```
#include <dng_misc_opcodes.h>
```

Inheritance diagram for `dng_opcode_MapTable`:

Public Member Functions

6.102.2 Constructor & Destructor Documentation

6.102.2.1 `dng_opcode_ScalePerColumn::dng_opcode_ScalePerColumn (const dng_area_spec &areaSpec, AutoPtr< dng_memory_block > &table)`

Create a ScalePerColumn opcode with the specified area and column scale factors (specified as a table of 32-bit floats).
References [AutoPtr< T >::Release\(\)](#), and [AutoPtr< T >::Reset\(\)](#).

6.102.3 Member Function Documentation

6.102.3.1 `dng_rect dng_opcode_ScalePerColumn::ModifiedBounds (const dng_rect &imageBounds)` `[virtual]`

The adjusted bounds (processing area) of this opcode. It is limited to the intersection of the specified image area and the GainMap area.

Reimplemented from [dng_inplace_opcode](#).

References [dng_area_spec::Overlap\(\)](#).

6.102.3.2 `void dng_opcode_ScalePerColumn::ProcessArea (dng_negative &negative, uint32 threadIndex, dng_pixel_buffer &buffer, const dng_rect &dstArea, const dng_rect &imageBounds)` `[virtual]`

Implements image processing operation in a single buffer. The source pixels are provided as input to the buffer, and this routine calculates and writes the destination pixels to the same buffer. Ideally, no allocation should be done in this routine.

Parameters

<i>negative</i>	The negative associated with the pixels to be processed.
<i>threadIndex</i>	The thread on which this routine is being called, between 0 and threadCount - 1 for the threadCount passed to Prepare method.
<i>srcBuffer</i>	Input area and source pixels.
<i>dstBuffer</i>	Destination pixels.
<i>dstArea</i>	Destination pixel processing area.
<i>imageBounds</i>	Total image area to be processed; dstArea will always lie within these bounds.

Implements [dng_inplace_opcode](#).

References `dng_area_spec::Area()`, `dng_memory_block::Buffer_real32()`, `dng_area_spec::ColPitch()`, `dng_pixel_buffer::DirtyPixel_real32()`, `dng_area_spec::Overlap()`, `dng_area_spec::Plane()`, `dng_area_spec::Planes()`, `dng_pixel_buffer::Planes()`, `dng_area_spec::RowPitch()`, and `dng_pixel_buffer::RowStep()`.

6.102.3.3 void dng_opcode_ScalePerColumn::PutData (dng_stream & stream) const [virtual]

Write opcode to a stream.

Parameters

<code>stream</code>	The stream to which to write the opcode data.
---------------------	---

Reimplemented from [dng_opcode](#).

References `dng_area_spec::Area()`, `dng_memory_block::Buffer_real32()`, `dng_area_spec::ColPitch()`, `dng_stream::Put_real32()`, `dng_stream::Put_uint32()`, and `dng_area_spec::PutData()`.

6.103.1 Detailed Description

An opcode to apply a scale factor that varies per row. Within a row, the same scale factor is applied to all specified pixels.

6.103.2 Constructor & Destructor Documentation

6.103.2.1 `dng_opcode_ScalePerRow::dng_opcode_ScalePerRow (const dng_area_spec & areaSpec, AutoPtr< dng_memory_block > & table)`

Create a ScalePerRow opcode with the specified area and row scale factors (specified as a table of 32-bit floats).

References `AutoPtr< T >::Release()`, and `AutoPtr< T >::Reset()`.

6.103.3 Member Function Documentation

6.103.3.1 `dng_rect dng_opcode_ScalePerRow::ModifiedBounds (const dng_rect & imageBounds) [virtual]`

The adjusted bounds (processing area) of this opcode. It is limited to the intersection of the specified image area and the GainMap area.

Reimplemented from [dng_inplace_opcode](#).

References `dng_area_spec::Overlap()`.

6.103.3.2 `void dng_opcode_ScalePerRow::ProcessArea (dng_negative & negative, uint32 threadIndex, dng_pixel_buffer & buffer, const dng_rect & dstArea, const dng_rect & imageBounds) [virtual]`

Implements image processing operation in a single buffer. The source pixels are provided as input to the buffer, and this routine calculates and writes the destination pixels to the same buffer. Ideally, no allocation should be done in this routine.

Parameters

<i>negative</i>	The negative associated with the pixels to be processed.
<i>threadIndex</i>	The thread on which this routine is being called, between 0 and threadCount - 1 for the threadCount passed to Prepare method.
<i>srcBuffer</i>	Input area and source pixels.
<i>dstBuffer</i>	Destination pixels.
<i>dstArea</i>	Destination pixel processing area.
<i>imageBounds</i>	Total image area to be processed; dstArea will always lie within these bounds.

Implements [dng_inplace_opcode](#).

References `dng_area_spec::Area()`, `dng_memory_block::Buffer_real32()`, `dng_area_spec::ColPitch()`, `dng_pixel_buffer::DirtyPixel_real32()`, `dng_area_spec::Overlap()`, `dng_area_spec::Plane()`, `dng_area_spec::Planes()`, `dng_pixel_buffer::Planes()`, and `dng_area_spec::RowPitch()`.

6.103.3.3 `void dng_opcode_ScalePerRow::PutData (dng_stream & stream) const [virtual]`

Write opcode to a stream.

Parameters

<i>stream</i>	The stream to which to write the opcode data.
---------------	---

Reimplemented from [dng_opcode](#).

References [dng_area_spec::Area\(\)](#), [dng_memory_block::Buffer_real32\(\)](#), [dng_stream::Put_real32\(\)](#), [dng_stream::Put_uint32\(\)](#), [dng_area_spec::PutData\(\)](#), and [dng_area_spec::RowPitch\(\)](#).

6.109.1 Detailed Description

Holds a buffer of pixel data with "pixel geometry" metadata.

The pixel geometry describes the layout in terms of how many planes, rows and columns plus the steps (in bytes) between each column, row and plane.

6.109.2 Member Function Documentation

6.109.2.1 `const dng_rect& dng_pixel_buffer::Area () const` `[inline]`

Get extent of pixels in buffer

Return values

<i>Rectangle</i>	giving valid extent of buffer.
------------------	--------------------------------

Referenced by `dng_filter_opcode_task::ProcessArea()`.

6.109.2.2 `const void* dng_pixel_buffer::ConstPixel (int32 row, int32 col, uint32 plane = 0) const` `[inline]`

Get read-only untyped (void *) pointer to pixel data starting at a specific pixel in the buffer.

Parameters

<i>row</i>	Start row for buffer pointer.
<i>col</i>	Start column for buffer pointer.
<i>plane</i>	Start plane for buffer pointer.

Return values

<i>Pointer</i>	to pixel data as void *.
----------------	--------------------------

Referenced by `ConstPixel_int16()`, `ConstPixel_int32()`, `ConstPixel_int8()`, `ConstPixel_real32()`, `ConstPixel_uint16()`, `ConstPixel_uint32()`, `ConstPixel_uint8()`, `CopyArea()`, `EqualArea()`, `MaximumDifference()`, `dng_limit_float_depth_task::Process()`, `dng_render_task::ProcessArea()`, `dng_image::Put()`, and `RepeatArea()`.

6.109.2.3 `const int16* dng_pixel_buffer::ConstPixel_int16 (int32 row, int32 col, uint32 plane = 0) const` `[inline]`

Get read-only int16 * to pixel data starting at a specific pixel in the buffer.

Parameters

<i>row</i>	Start row for buffer pointer.
<i>col</i>	Start column for buffer pointer.
<i>plane</i>	Start plane for buffer pointer.

Return values

<i>Pointer</i>	to pixel data as int16 *.
----------------	---------------------------

References `ConstPixel()`.

6.109.2.4 `const int32* dng_pixel_buffer::ConstPixel_int32 (int32 row, int32 col, uint32 plane = 0) const` `[inline]`

Get read-only int32 * to pixel data starting at a specific pixel in the buffer.

Parameters

<i>row</i>	Start row for buffer pointer.
<i>col</i>	Start column for buffer pointer.
<i>plane</i>	Start plane for buffer pointer.

Return values

<i>Pointer</i>	to pixel data as int32 *.
----------------	---------------------------

References ConstPixel().

6.109.2.5 `const int8* dng_pixel_buffer::ConstPixel_int8 (int32 row, int32 col, uint32 plane = 0) const` `[inline]`

Get read-only int8 * to pixel data starting at a specific pixel in the buffer.

Parameters

<i>row</i>	Start row for buffer pointer.
<i>col</i>	Start column for buffer pointer.
<i>plane</i>	Start plane for buffer pointer.

Return values

<i>Pointer</i>	to pixel data as int8 *.
----------------	--------------------------

References ConstPixel().

6.109.2.6 `const real32* dng_pixel_buffer::ConstPixel_real32 (int32 row, int32 col, uint32 plane = 0) const` `[inline]`

Get read-only real32 * to pixel data starting at a specific pixel in the buffer.

Parameters

<i>row</i>	Start row for buffer pointer.
<i>col</i>	Start column for buffer pointer.
<i>plane</i>	Start plane for buffer pointer.

Return values

<i>Pointer</i>	to pixel data as real32 *.
----------------	----------------------------

References ConstPixel().

Referenced by dng_resample_task::ProcessArea(), and dng_filter_warp::ProcessArea().

6.109.2.7 `const uint16* dng_pixel_buffer::ConstPixel_uint16 (int32 row, int32 col, uint32 plane = 0) const` `[inline]`

Get read-only uint16 * to pixel data starting at a specific pixel in the buffer.

Parameters

<i>row</i>	Start row for buffer pointer.
<i>col</i>	Start column for buffer pointer.
<i>plane</i>	Start plane for buffer pointer.

Return values

<i>Pointer</i>	to pixel data as uint16 *.
----------------	----------------------------

References ConstPixel().

Referenced by dng_encode_proxy_task::Process(), dng_opcode_FixBadPixelsConstant::ProcessArea(), dng_resample_task::ProcessArea(), dng_opcode_FixVignetteRadial::ProcessArea(), and dng_fast_interpolator::ProcessArea().

6.109.2.8 `const uint32* dng_pixel_buffer::ConstPixel_uint32 (int32 row, int32 col, uint32 plane = 0) const` [inline]

Get read-only uint32 * to pixel data starting at a specific pixel in the buffer.

Parameters

<i>row</i>	Start row for buffer pointer.
<i>col</i>	Start column for buffer pointer.
<i>plane</i>	Start plane for buffer pointer.

Return values

<i>Pointer</i>	to pixel data as uint32 *.
----------------	----------------------------

References ConstPixel().

6.109.2.9 `const uint8* dng_pixel_buffer::ConstPixel_uint8 (int32 row, int32 col, uint32 plane = 0) const` [inline]

Get read-only uint8 * to pixel data starting at a specific pixel in the buffer.

Parameters

<i>row</i>	Start row for buffer pointer.
<i>col</i>	Start column for buffer pointer.
<i>plane</i>	Start plane for buffer pointer.

Return values

<i>Pointer</i>	to pixel data as uint8 *.
----------------	---------------------------

References ConstPixel().

6.109.2.10 `void dng_pixel_buffer::CopyArea (const dng_pixel_buffer & src, const dng_rect & area, uint32 srcPlane, uint32 dstPlane, uint32 planes)`

Copy image data from an area of one pixel buffer to same area of another.

Parameters

<i>src</i>	Buffer to copy from.
<i>area</i>	Rectangle of pixel buffer to copy.
<i>srcPlane</i>	Plane to start copy in src.
<i>dstPlane</i>	Plane to start copy in dst.
<i>planes</i>	Number of planes to copy.

References ConstPixel(), DirtyPixel(), PixelRange(), and ThrowNotYetImplemented().

Referenced by dng_image::CopyArea(), CopyArea(), dng_opcode_FixBadPixelsConstant::ProcessArea(), and dng_opcode_FixBadPixelsList::ProcessArea().

6.109.2.11 void dng_pixel_buffer::CopyArea (const dng_pixel_buffer & *src*, const dng_rect & *area*, uint32 *plane*, uint32 *planes*) [inline]

Copy image data from an area of one pixel buffer to same area of another.

Parameters

<i>src</i>	Buffer to copy from.
<i>area</i>	Rectangle of pixel buffer to copy.
<i>plane</i>	Plane to start copy in src and this.
<i>planes</i>	Number of planes to copy.

References CopyArea().

6.109.2.12 void* dng_pixel_buffer::DirtyPixel (int32 *row*, int32 *col*, uint32 *plane* = 0) [inline]

Get a writable untyped (void *) pointer to pixel data starting at a specific pixel in the buffer.

Parameters

<i>row</i>	Start row for buffer pointer.
<i>col</i>	Start column for buffer pointer.
<i>plane</i>	Start plane for buffer pointer.

Return values

<i>Pointer</i>	to pixel data as void *.
----------------	--------------------------

References DNG_ASSERT.

Referenced by CopyArea(), DirtyPixel_int16(), DirtyPixel_int32(), DirtyPixel_int8(), DirtyPixel_real32(), DirtyPixel_uint16(), DirtyPixel_uint32(), DirtyPixel_uint8(), dng_image::Get(), dng_limit_float_depth_task::Process(), RepeatArea(), dng_simple_image::Rotate(), SetConstant(), ShiftRight(), and dng_simple_image::Trim().

6.109.2.13 int16* dng_pixel_buffer::DirtyPixel_int16 (int32 *row*, int32 *col*, uint32 *plane* = 0) [inline]

Get a writable int16 * to pixel data starting at a specific pixel in the buffer.

Parameters

<i>row</i>	Start row for buffer pointer.
<i>col</i>	Start column for buffer pointer.
<i>plane</i>	Start plane for buffer pointer.

Return values

<i>Pointer</i>	to pixel data as int16 *.
----------------	---------------------------

References DirtyPixel().

6.109.2.14 `int32* dng_pixel_buffer::DirtyPixel_int32 (int32 row, int32 col, uint32 plane = 0) [inline]`

Get a writable int32 * to pixel data starting at a specific pixel in the buffer.

Parameters

<i>row</i>	Start row for buffer pointer.
<i>col</i>	Start column for buffer pointer.
<i>plane</i>	Start plane for buffer pointer.

Return values

<i>Pointer</i>	to pixel data as int32 *.
----------------	---------------------------

References DirtyPixel().

6.109.2.15 `int8* dng_pixel_buffer::DirtyPixel_int8 (int32 row, int32 col, uint32 plane = 0) [inline]`

Get a writable int8 * to pixel data starting at a specific pixel in the buffer.

Parameters

<i>row</i>	Start row for buffer pointer.
<i>col</i>	Start column for buffer pointer.
<i>plane</i>	Start plane for buffer pointer.

Return values

<i>Pointer</i>	to pixel data as int8 *.
----------------	--------------------------

References DirtyPixel().

6.109.2.16 `real32* dng_pixel_buffer::DirtyPixel_real32 (int32 row, int32 col, uint32 plane = 0) [inline]`

Get a writable real32 * to pixel data starting at a specific pixel in the buffer.

Parameters

<i>row</i>	Start row for buffer pointer.
<i>col</i>	Start column for buffer pointer.
<i>plane</i>	Start plane for buffer pointer.

Return values

<i>Pointer</i>	to pixel data as real32 *.
----------------	----------------------------

References DirtyPixel().

6.109.2.18 `uint32* dng_pixel_buffer::DirtyPixel_uint32 (int32 row, int32 col, uint32 plane = 0) [inline]`

Get a writable uint32 * to pixel data starting at a specific pixel in the buffer.

Parameters

<i>row</i>	Start row for buffer pointer.
<i>col</i>	Start column for buffer pointer.
<i>plane</i>	Start plane for buffer pointer.

Return values

<i>Pointer</i>	to pixel data as uint32 *.
----------------	----------------------------

References DirtyPixel().

6.109.2.19 `uint8* dng_pixel_buffer::DirtyPixel_uint8 (int32 row, int32 col, uint32 plane = 0) [inline]`

Get a writable uint8 * to pixel data starting at a specific pixel in the buffer.

Parameters

<i>row</i>	Start row for buffer pointer.
<i>col</i>	Start column for buffer pointer.
<i>plane</i>	Start plane for buffer pointer.

Return values

<i>Pointer</i>	to pixel data as uint8 *.
----------------	---------------------------

6.109.2.20 `bool dng_pixel_buffer::EqualArea (const dng_pixel_buffer & rhs, const dng_rect & area, uint32 plane, uint32 planes) const`

Return true if the contents of an area of the pixel buffer area are the same as those of another.

Parameters

<i>rhs</i>	Buffer to compare against.
<i>area</i>	Rectangle of pixel buffer to test.
<i>plane</i>	Plane to start comparing.
<i>planes</i>	Number of planes to compare.

Return values

<i>bool</i>	true if areas are equal, false otherwise.
-------------	---

References ConstPixel(), and ThrowNotYetImplemented().

Referenced by dng_image::EqualArea().

6.109.2.21 `void dng_pixel_buffer::FlipH ()`

Change metadata so pixels are iterated in opposite horizontal order. This operation does not require movement of actual pixel data.

6.109.2.22 `void dng_pixel_buffer::FlipV ()`

Change metadata so pixels are iterated in opposite vertical order. This operation does not require movement of actual pixel data.

6.109.2.23 `void dng_pixel_buffer::FlipZ ()`

Change metadata so pixels are iterated in opposite plane order. This operation does not require movement of actual pixel data.

6.109.2.24 `real64 dng_pixel_buffer::MaximumDifference (const dng_pixel_buffer & rhs, const dng_rect & area, uint32 plane, uint32 planes) const`

Return the absolute value of the maximum difference between two pixel buffers. Used for comparison testing with tolerance

Parameters

<i>rhs</i>	Buffer to compare against.
<i>area</i>	Rectangle of pixel buffer to test.
<i>plane</i>	Plane to start comparing.
<i>planes</i>	Number of planes to compare.

Return values

<i>larges</i>	absolute value difference between the corresponding pixels each buffer across area.
---------------	---

References ConstPixel(), ThrowNotYetImplemented(), and ThrowProgramError().

6.109.2.25 uint32 dng_pixel_buffer::PixelRange () const

Get the range of pixel values.

Return values

<i>Range</i>	of value a pixel can take. (Meaning [0, max] for unsigned case. Signed case is biased so [-32768, max - 32768].)
--------------	--

Referenced by CopyArea().

6.109.2.26 uint32 dng_pixel_buffer::Planes () const [inline]

Number of planes of image data.

Return values

<i>Number</i>	of planes held in buffer.
---------------	---------------------------

Referenced by dng_opcode_MapTable::ProcessArea(), dng_opcode_GainMap::ProcessArea(), dng_opcode_MapPolynomial::ProcessArea(), dng_opcode_DeltaPerRow::ProcessArea(), dng_opcode_DeltaPerColumn::ProcessArea(), dng_opcode_ScalePerRow::ProcessArea(), and dng_opcode_ScalePerColumn::ProcessArea().

6.109.2.27 int32 dng_pixel_buffer::PlaneStep () const [inline]

Step, in pixels not bytes, between planes of data in buffer.

Return values

<i>plane</i>	step in pixels. May be negative.
--------------	----------------------------------

Referenced by dng_opcode_FixVignetteRadial::ProcessArea().

6.109.2.28 void dng_pixel_buffer::RepeatArea (const dng_rect & srcArea, const dng_rect & dstArea)

Repeat the image data in srcArea across dstArea. (Generally used for padding operations.)

Parameters

<i>srcArea</i>	Area to repeat from.
<i>dstArea</i>	Area to fill with data from srcArea.

References ConstPixel(), DirtyPixel(), RepeatPhase(), and ThrowNotYetImplemented().

Referenced by RepeatSubArea().

6.109.2.29 dng_point dng_pixel_buffer::RepeatPhase (const dng_rect & srcArea, const dng_rect & dstArea) [static]

Calculate the offset phase of destination rectangle relative to source rectangle. Phase is based on a 0,0 origin and the notion of repeating srcArea across dstArea. It is the number of pixels into srcArea to start repeating from when tiling dstArea.

Return values

dng_point	containing horizontal and vertical phase.
---------------------------	---

Referenced by RepeatArea().

6.109.2.30 `int32 dng_pixel_buffer::RowStep () const [inline]`

Step, in pixels not bytes, between rows of data in buffer.

Return values

<i>row</i>	step in pixels. May be negative.
------------	----------------------------------

Referenced by `dng_opcode_MapTable::ProcessArea()`, `dng_opcode_DeltaPerColumn::ProcessArea()`, `dng_opcode_ScalePerColumn::ProcessArea()`, `dng_opcode_FixVignetteRadial::ProcessArea()`, and `dng_filter_warp::ProcessArea()`.

6.109.2.31 `void dng_pixel_buffer::SetConstant (const dng_rect & area, uint32 plane, uint32 planes, uint32 value)`

Initialize a rectangular area of pixel buffer to a constant.

Parameters

<i>area</i>	Rectangle of pixel buffer to set.
<i>plane</i>	Plane to start filling on.
<i>planes</i>	Number of planes to fill.
<i>value</i>	Constant value to set pixels to.

References `DirtyPixel()`, and `ThrowNotYetImplemented()`.

Referenced by `SetConstant_int16()`, `SetConstant_real32()`, `SetConstant_uint16()`, `SetConstant_uint32()`, `SetConstant_uint8()`, and `SetZero()`.

6.109.2.32 `void dng_pixel_buffer::SetConstant_int16 (const dng_rect & area, uint32 plane, uint32 planes, int16 value) [inline]`

Initialize a rectangular area of pixel buffer to a constant signed 16-bit value.

Parameters

<i>area</i>	Rectangle of pixel buffer to set.
<i>plane</i>	Plane to start filling on.
<i>planes</i>	Number of planes to fill.
<i>value</i>	Constant int16 value to set pixels to.

References `DNG_ASSERT`, and `SetConstant()`.

6.109.2.33 `void dng_pixel_buffer::SetConstant_real32 (const dng_rect & area, uint32 plane, uint32 planes, real32 value) [inline]`

Initialize a rectangular area of pixel buffer to a constant real 32-bit value.

Parameters

<i>area</i>	Rectangle of pixel buffer to set.
<i>plane</i>	Plane to start filling on.
<i>planes</i>	Number of planes to fill.
<i>value</i>	Constant real32 value to set pixels to.

References `DNG_ASSERT`, and `SetConstant()`.

6.109.2.34 `void dng_pixel_buffer::SetConstant_uint16 (const dng_rect & area, uint32 plane, uint32 planes, uint16 value)`
`[inline]`

Initialize a rectangular area of pixel buffer to a constant unsigned 16-bit value.

Parameters

<i>area</i>	Rectangle of pixel buffer to set.
<i>plane</i>	Plane to start filling on.
<i>planes</i>	Number of planes to fill.
<i>value</i>	Constant uint16 value to set pixels to.

References DNG_ASSERT, and SetConstant().

6.109.2.35 `void dng_pixel_buffer::SetConstant_uint32 (const dng_rect & area, uint32 plane, uint32 planes, uint32 value)`
`[inline]`

Initialize a rectangular area of pixel buffer to a constant unsigned 32-bit value.

Parameters

<i>area</i>	Rectangle of pixel buffer to set.
<i>plane</i>	Plane to start filling on.
<i>planes</i>	Number of planes to fill.
<i>value</i>	Constant uint32 value to set pixels to.

References DNG_ASSERT, and SetConstant().

6.109.2.36 `void dng_pixel_buffer::SetConstant_uint8 (const dng_rect & area, uint32 plane, uint32 planes, uint8 value)`
`[inline]`

Initialize a rectangular area of pixel buffer to a constant unsigned 8-bit value.

Parameters

<i>area</i>	Rectangle of pixel buffer to set.
<i>plane</i>	Plane to start filling on.
<i>planes</i>	Number of planes to fill.
<i>value</i>	Constant uint8 value to set pixels to.

References DNG_ASSERT, and SetConstant().

6.109.2.37 `void dng_pixel_buffer::SetZero (const dng_rect & area, uint32 plane, uint32 planes)`

Initialize a rectangular area of pixel buffer to zeros.

Parameters

<i>area</i>	Rectangle of pixel buffer to zero.
<i>area</i>	Area to zero
<i>plane</i>	Plane to start filling on.
<i>planes</i>	Number of planes to fill.

References SetConstant(), and ThrowNotYetImplemented().

6.109.2.38 void dng_pixel_buffer::ShiftRight (uint32 *shift*)

Apply a right shift (C++ oerpator >>) to all pixel values. Only implemented for 16-bit (signed or unsigned) pixel buffers.

Parameters

<i>shift</i>	Number of bits by which to right shift each pixel value.
--------------	--

Additional Inherited Members

6.119.1 Member Function Documentation

6.119.1.1 void `dng_read_tiles_task::Process` (uint32 *threadIndex*, const `dng_rect` & *tile*, `dng_abort_sniffer` * *sniffer*)
 [inline], [virtual]

Process one tile or fully partitioned area. This method is overridden by derived classes to implement the actual image processing. Note that the sniffer can be ignored if it is certain that a processing task will complete very quickly. This method should never be called directly but rather accessed via `Process`. There is no allocator parameter as all allocation should be done in `Start`.

Parameters

<i>threadIndex</i>	0 to threadCount - 1 index indicating which thread this is. (Can be used to get a thread-specific buffer allocated in the <code>Start</code> method.)
<i>tile</i>	Area to process.
<i>sniffer</i>	dng_abort_sniffer to use to check for user cancellation and progress updates.

Implements [dng_area_task](#).

References `dng_host::Allocate()`, `dng_host::Allocator()`, `dng_memory_block::Buffer()`, `dng_stream::Get()`, `dng_stream::LittleEndian()`, `dng_md5_printer::Process()`, `AutoPtr< T >::Reset()`, `dng_md5_printer::Result()`, `dng_stream::SetLittleEndian()`, `dng_stream::SetReadPosition()`, and `dng_abort_sniffer::SniffForAbort()`.

6.122.1 Detailed Description

Class to provide resource acquisition is instantiation discipline for small memory allocations.

Support for a refcounted block, with optional copy-on-write This class does not use [dng_memory_allocator](#) for memory allocation.

6.122.2 Constructor & Destructor Documentation

6.122.2.1 dng_ref_counted_block::dng_ref_counted_block ()

Construct an empty memory buffer using malloc.

Exceptions

dng_memory_full	with fErrorCode equal to dng_error_memory .
---------------------------------	---

6.122.2.2 dng_ref_counted_block::dng_ref_counted_block (uint32 size)

Construct memory buffer of size bytes using malloc.

Parameters

<i>size</i>	Number of bytes of memory needed.
-------------	-----------------------------------

Exceptions

dng_memory_full	with fErrorCode equal to dng_error_memory .
---------------------------------	---

References [Allocate\(\)](#).

6.122.3 Member Function Documentation

6.122.3.1 void dng_ref_counted_block::Allocate (uint32 *size*)

Clear existing memory buffer and allocate new memory of size bytes.

Parameters

<i>size</i>	Number of bytes of memory needed.
-------------	-----------------------------------

Exceptions

<i>dng_memory_full</i>	with <code>fErrorCode</code> equal to <code>dng_error_memory</code> .
------------------------	---

References `Clear()`, and `ThrowMemoryFull()`.

Referenced by `dng_ref_counted_block()`, `EnsureWriteable()`, and `dng_hue_sat_map::SetDivisions()`.

6.122.3.2 const void* dng_ref_counted_block::Buffer () const [inline]

Return pointer to allocated memory as a `const void *`.

Return values

<i>const</i>	<code>void *</code> valid for as many bytes as were allocated.
--------------	--

6.122.3.3 char* dng_ref_counted_block::Buffer_char () [inline]

Return pointer to allocated memory as a `char *`.

Return values

<i>char</i>	<code>*</code> valid for as many bytes as were allocated.
-------------	---

6.122.3.4 const char* dng_ref_counted_block::Buffer_char () const [inline]

Return pointer to allocated memory as a `const char *`.

Return values

<i>const</i>	<code>char *</code> valid for as many bytes as were allocated.
--------------	--

6.122.3.5 int16* dng_ref_counted_block::Buffer_int16 () [inline]

Return pointer to allocated memory as a `int16 *`.

Return values

<i>int16</i>	<code>*</code> valid for as many bytes as were allocated.
--------------	---

6.122.3.6 const int16* dng_ref_counted_block::Buffer_int16 () const [inline]

Return pointer to allocated memory as a `const int16 *`.

Return values

<i>const</i>	int16 * valid for as many bytes as were allocated.
--------------	--

6.122.3.7 int32* dng_ref_counted_block::Buffer_int32 () [inline]

Return pointer to allocated memory as a const int32 *.

Return values

<i>const</i>	int32 * valid for as many bytes as were allocated.
--------------	--

6.122.3.8 const int32* dng_ref_counted_block::Buffer_int32 () const [inline]

Return pointer to allocated memory as a const int32 *.

Return values

<i>const</i>	int32 * valid for as many bytes as were allocated.
--------------	--

6.122.3.9 int64* dng_ref_counted_block::Buffer_int64 () [inline]

Return pointer to allocated memory as a const int64 *.

Return values

<i>const</i>	int64 * valid for as many bytes as were allocated.
--------------	--

6.122.3.10 const int64* dng_ref_counted_block::Buffer_int64 () const [inline]

Return pointer to allocated memory as a const int64 *.

Return values

<i>const</i>	int64 * valid for as many bytes as were allocated.
--------------	--

6.122.3.11 real32* dng_ref_counted_block::Buffer_real32 () [inline]

Return pointer to allocated memory as a real32 *.

Return values

<i>real32</i>	* valid for as many bytes as were allocated.
---------------	--

Referenced by dng_hue_sat_map::GetConstDeltas(), and dng_hue_sat_map::GetDeltas().

6.122.3.12 const real32* dng_ref_counted_block::Buffer_real32 () const [inline]

Return pointer to allocated memory as a const real32 *.

Return values

<i>const</i>	real32 * valid for as many bytes as were allocated.
--------------	---

6.122.3.13 `real64* dng_ref_counted_block::Buffer_real64 () [inline]`

Return pointer to allocated memory as a `real64 *`.

Return values

<i>real64</i>	* valid for as many bytes as were allocated.
---------------	--

6.122.3.14 `const real64* dng_ref_counted_block::Buffer_real64 () const [inline]`

Return pointer to allocated memory as a `const real64 *`.

Return values

<i>const</i>	<i>real64 *</i> valid for as many bytes as were allocated.
--------------	--

6.122.3.15 `uint16* dng_ref_counted_block::Buffer_uint16 () [inline]`

Return pointer to allocated memory as a `uint16 *`.

Return values

<i>uint16</i>	* valid for as many bytes as were allocated.
---------------	--

6.122.3.16 `const uint16* dng_ref_counted_block::Buffer_uint16 () const [inline]`

Return pointer to allocated memory as a `const uint16 *`.

Return values

<i>const</i>	<i>uint16 *</i> valid for as many bytes as were allocated.
--------------	--

6.122.3.17 `uint32* dng_ref_counted_block::Buffer_uint32 () [inline]`

Return pointer to allocated memory as a `uint32 *`.

Return values

<i>uint32</i>	* valid for as many bytes as were allocated.
---------------	--

6.122.3.18 `const uint32* dng_ref_counted_block::Buffer_uint32 () const [inline]`

Return pointer to allocated memory as a `uint32 *`.

Return values

<i>uint32</i>	* valid for as many bytes as were allocated.
---------------	--

6.122.3.19 `uint64* dng_ref_counted_block::Buffer_uint64 () [inline]`

Return pointer to allocated memory as a `uint64 *`.

Return values

<i>uint64</i>	* valid for as many bytes as were allocated.
---------------	--

6.122.3.20 `const uint64* dng_ref_counted_block::Buffer_uint64 () const [inline]`

Return pointer to allocated memory as a uint64 *.

Return values

<i>uint64</i>	* valid for as many bytes as were allocated.
---------------	--

6.122.3.21 `uint8* dng_ref_counted_block::Buffer_uint8 () [inline]`

Return pointer to allocated memory as a uint8 *.

Return values

<i>uint8</i>	* valid for as many bytes as were allocated.
--------------	--

6.122.3.22 `const uint8* dng_ref_counted_block::Buffer_uint8 () const [inline]`

Return pointer to allocated memory as a const uint8 *.

Return values

<i>const</i>	uint8 * valid for as many bytes as were allocated.
--------------	--

6.122.3.23 `void dng_ref_counted_block::Clear ()`

Release any allocated memory using free. Object is still valid and Allocate can be called again.

Referenced by Allocate(), operator=(), dng_hue_sat_map::SetInvalid(), and ~dng_ref_counted_block().

6.122.3.24 `uint32 dng_ref_counted_block::LogicalSize () [inline]`

Return pointer to allocated memory as a void *..

Return values

<i>void</i>	* valid for as many bytes as were allocated.
-------------	--

6.123.1 Detailed Description

Class used to render digital negative to displayable image.

6.123.2 Constructor & Destructor Documentation

6.123.2.1 [dng_render::dng_render](#) ([dng_host](#) & *host*, const [dng_negative](#) & *negative*)

Construct a rendering instance that will be used to convert a given digital negative.

Parameters

<i>host</i>	The host to use for memory allocation, progress updates, and abort testing.
<i>negative</i>	The digital negative to convert to a displayable image.

References [dng_camera_profile::DefaultBlackRender\(\)](#), [AutoPtr< T >::Get\(\)](#), [dng_1d_identity::Get\(\)](#), [AutoPtr< T >::Reset\(\)](#), and [dng_camera_profile::ToneCurve\(\)](#).

6.123.3 Member Function Documentation

6.123.3.1 `real64 dng_render::Exposure () const [inline]`

Get exposure compensation.

Return values

<i>Compensation</i>	value in stops, positive or negative.
---------------------	---------------------------------------

Referenced by `dng_render_task::Start()`.

6.123.3.2 `uint32 dng_render::FinalPixelType () const [inline]`

Get pixel type of final image data. Can be `ttByte` (default), `ttShort`, or `ttFloat`.

Return values

<i>Pixel</i>	type to use.
--------------	--------------

Referenced by `Render()`.

6.123.3.3 `const dng_color_space& dng_render::FinalSpace () const [inline]`

Get final color space in which resulting image data should be represented.

Return values

<i>Color</i>	space to use.
--------------	---------------

Referenced by `Render()`, and `dng_render_task::Start()`.

6.123.3.4 `uint32 dng_render::MaximumSize () const [inline]`

Get maximum dimension, in pixels, of resulting image. If the final image would have either dimension larger than this maximum, the larger of the two dimensions is set to this maximum size and the smaller dimension is adjusted to preserve the image's aspect ratio.

Return values

<i>Maximum</i>	allowed size.
----------------	---------------

Referenced by `Render()`.

6.123.3.5 `dng_image * dng_render::Render () [virtual]`

Actually render a digital negative to a displayable image. Input digital negative is passed to the constructor of this [dng_render](#) class.

Return values

<i>The</i>	final resulting image.
------------	------------------------

References `dng_negative::AspectRatio()`, `dng_image::Bounds()`, `dng_negative::DefaultCropArea()`, `dng_negative::DefaultFinalHeight()`, `dng_negative::DefaultFinalWidth()`, `FinalPixelType()`, `FinalSpace()`, `AutoPtr< T >::Get()`, `dng_color_space::IsMonochrome()`, `dng_host::Make_dng_image()`, `MaximumSize()`, `dng_host::PerformAreaTask()`, `dng_`

image::PixelType(), dng_image::Planes(), AutoPtr< T >::Release(), and AutoPtr< T >::Reset().

6.123.3.6 void dng_render::SetExposure (real64 *exposure*) [inline]

Set exposure compensation.

Parameters

<i>exposure</i>	Compensation value in stops, positive or negative.
-----------------	--

6.123.3.7 void dng_render::SetFinalPixelType (uint32 *type*) [inline]

Set pixel type of final image data. Can be ttByte (default), ttShort, or ttFloat.

Parameters

<i>type</i>	Pixel type to use.
-------------	--------------------

6.123.3.8 void dng_render::SetFinalSpace (const dng_color_space & *space*) [inline]

Set final color space in which resulting image data should be represented. (See [dng_color_space.h](#) for possible values.)

Parameters

<i>space</i>	Color space to use.
--------------	---------------------

6.123.3.9 void dng_render::SetMaximumSize (uint32 *size*) [inline]

Set maximum dimension, in pixels, of resulting image. If final image would have either dimension larger than maximum, the larger of the two dimensions is set to this maximum size and the smaller dimension is adjusted to preserve aspect ratio.

Parameters

<i>size</i>	Maximum size to allow.
-------------	------------------------

6.123.3.10 void dng_render::SetShadows (real64 *shadows*) [inline]

Set shadow clip amount.

Parameters

<i>shadows</i>	Shadow clip amount.
----------------	---------------------

6.123.3.11 void dng_render::SetToneCurve (const dng_1d_function & *curve*) [inline]

Set custom tone curve for conversion.

Parameters

<i>curve</i>	1D function that defines tone mapping to use during conversion.
--------------	---

6.123.3.12 `void dng_render::SetWhiteXY (const dng_xy_coord & white) [inline]`

Set the white point to be used for conversion.

Parameters

<i>white</i>	White point to use.
--------------	---------------------

6.123.3.13 `real64 dng_render::Shadows () const [inline]`

Get shadow clip amount.

Return values

<i>Shadow</i>	clip amount.
---------------	--------------

Referenced by `dng_render_task::Start()`.

6.123.3.14 `const dng_1d_function& dng_render::ToneCurve () const [inline]`

Get custom tone curve for conversion.

Return values

<i>1D</i>	function that defines tone mapping to use during conversion.
-----------	--

Referenced by `dng_render_task::Start()`.

6.123.3.15 `const dng_xy_coord dng_render::WhiteXY () const [inline]`

Get the white point to be used for conversion.

Return values

<i>White</i>	point to use.
--------------	---------------

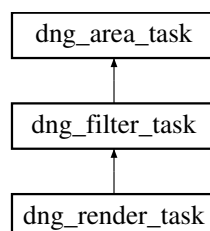

Referenced by `dng_render_task::Start()`.

6.124.1 Member Function Documentation

6.124.1.1 void [dng_render_task::ProcessArea](#) (uint32 *threadIndex*, [dng_pixel_buffer](#) & *srcBuffer*, [dng_pixel_buffer](#) & *dstBuffer*) [virtual]

Implements filtering operation from one buffer to another. Source and destination pixels are set up in member fields of this class. Ideally, no allocation should be done in this routine.

Parameters

<i>threadIndex</i>	The thread on which this routine is being called, between 0 and threadCount - 1 for the thread-Count passed to Start method.
<i>srcBuffer</i>	Input area and source pixels.
<i>dstBuffer</i>	Output area and destination pixels.

Implements [dng_filter_task](#).

References [dng_memory_block::Buffer_real32\(\)](#), [dng_pixel_buffer::ConstPixel\(\)](#), [dng_pixel_buffer::DirtyPixel_real32\(\)](#), and [AutoPtr< T >::Get\(\)](#).

6.124.1.2 [dng_rect dng_render_task::SrcArea](#) (const [dng_rect](#) & *dstArea*) [virtual]

Compute the source area needed for a given destination area. Default implementation assumes destination area is equal to source area for all cases.

Parameters

<i>dstArea</i>	Area to for which pixels will be computed.
----------------	--

Return values

<i>The</i>	source area needed as input to calculate the requested destination area.
------------	--

Reimplemented from [dng_filter_task](#).

6.124.1.3 void dng_render_task::Start (uint32 *threadCount*, const dng_point & *tileSize*, dng_memory_allocator * *allocator*, dng_abort_sniffer * *sniffer*) [virtual]

Called prior to processing on specific threads. Can be used to allocate per-thread memory buffers, etc.

Parameters

<i>threadCount</i>	Total number of threads that will be used for processing. Less than or equal to MaxThreads of dng_area_task .
<i>tileSize</i>	Size of source tiles which will be processed. (Not all tiles will be this size due to edge conditions.)
<i>allocator</i>	dng_memory_allocator to use for allocating temporary buffers, etc.
<i>sniffer</i>	Sniffer to test for user cancellation and to set up progress.

Reimplemented from [dng_filter_task](#).

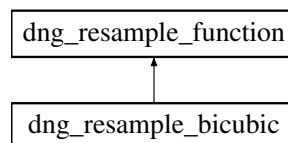

References dng_memory_allocator::Allocate(), dng_negative::CameraNeutral(), dng_render::Exposure(), dng_render::FinalSpace(), dng_color_space::GammaFunction(), dng_space_ProPhoto::Get(), dng_negative::HasCameraNeutral(), dng_camera_profile::HasLookTable(), dng_camera_profile::HueSatMapEncoding(), dng_camera_profile::HueSatMapForWhite(), dng_1d_table::Initialize(), dng_negative::IsMonochrome(), dng_camera_profile::LookTable(), dng_camera_profile::LookTableEncoding(), dng_color_space::MatrixFromPCS(), dng_color_space::MatrixToPCS(), AutoPtr< T >::Reset(), dng_render::Shadows(), dng_negative::ShadowScale(), dng_render::ToneCurve(), dng_negative::TotalBaselineExposure(), and dng_render::WhiteXY().

6.128.1 Member Function Documentation

6.128.1.1 void `dng_resample_task::ProcessArea` (uint32 *threadIndex*, [dng_pixel_buffer](#) & *srcBuffer*, [dng_pixel_buffer](#) & *dstBuffer*) `[virtual]`

Implements filtering operation from one buffer to another. Source and destination pixels are set up in member fields of this class. Ideally, no allocation should be done in this routine.

Parameters

<i>threadIndex</i>	The thread on which this routine is being called, between 0 and threadCount - 1 for the threadCount passed to Start method.
<i>srcBuffer</i>	Input area and source pixels.
<i>dstBuffer</i>	Output area and destination pixels.

Implements [dng_filter_task](#).

References [dng_memory_block::Buffer_real32\(\)](#), [dng_memory_block::Buffer_uint16\(\)](#), [dng_pixel_buffer::ConstPixel_real32\(\)](#), [dng_pixel_buffer::ConstPixel_uint16\(\)](#), [dng_pixel_buffer::DirtyPixel_real32\(\)](#), [dng_pixel_buffer::DirtyPixel_uint16\(\)](#), and [dng_image::PixelRange\(\)](#).

6.128.1.2 dng_rect dng_resample_task::SrcArea (const dng_rect & dstArea) [virtual]

Compute the source area needed for a given destination area. Default implementation assumes destination area is equal to source area for all cases.

Parameters

<i>dstArea</i>	Area to for which pixels will be computed.
----------------	--

Return values

<i>The</i>	source area needed as input to calculate the requested destination area.
------------	--

Reimplemented from [dng_filter_task](#).

6.128.1.3 dng_point dng_resample_task::SrcTileSize (const dng_point & dstTileSize) [virtual]

Given a destination tile size, calculate input tile size. Similar to SrcArea, and should seldom be overridden.

Parameters

<i>dstTileSize</i>	The destination tile size that is targeted for output.
--------------------	--

Return values

<i>The</i>	source tile size needed to compute a tile of the destination size.
------------	--

Reimplemented from [dng_filter_task](#).

6.128.1.4 void dng_resample_task::Start (uint32 threadCount, const dng_point & tileSize, dng_memory_allocator * allocator, dng_abort_sniffer * sniffer) [virtual]

Called prior to processing on specific threads. Can be used to allocate per-thread memory buffers, etc.

Parameters

<i>threadCount</i>	Total number of threads that will be used for processing. Less than or equal to MaxThreads of dng_area_task .
<i>tileSize</i>	Size of source tiles which will be processed. (Not all tiles will be this size due to edge conditions.)
<i>allocator</i>	dng_memory_allocator to use for allocating temporary buffers, etc.
<i>sniffer</i>	Sniffer to test for user cancellation and to set up progress.

Reimplemented from [dng_filter_task](#).

- [dng_memory_allocator](#) & **fAllocator**

Additional Inherited Members

6.135.1 Detailed Description

[dng_image](#) derived class with simple Trim and Rotate functionality.

The documentation for this class was generated from the following files:

- [dng_simple_image.h](#)
- [dng_simple_image.cpp](#)

6.136 dng_sniffer_task Class Reference

Class to establish scope of a named subtask in DNG processing.

```
#include <dng_abort_sniffer.h>
```

Public Member Functions

- [dng_sniffer_task](#) ([dng_abort_sniffer](#) *sniffer, const char *name=NULL, real64 fract=0.0)
- void [Sniff](#) ()
- void [UpdateProgress](#) (real64 fract)
- void [UpdateProgress](#) (uint32 done, uint32 total)
- void [Finish](#) ()

Signal task completed for progress purposes.

6.136.1 Detailed Description

Class to establish scope of a named subtask in DNG processing.

Instances of this class are intended to be stack allocated.

6.136.2 Constructor & Destructor Documentation

6.136.2.1 `dng_sniffer_task::dng_sniffer_task (dng_abort_sniffer * sniffer, const char * name = NULL, real64 fract = 0.0)` `[inline]`

Inform a sniffer of a subtask in DNG processing.

Parameters

<i>sniffer</i>	The sniffer associated with the host on which this processing is occurring.
<i>name</i>	The name of this subtask as a NUL terminated string.
<i>fract</i>	Percentage of total processing this task is expected to take, from 0.0 to 1.0 .

References [dng_abort_sniffer::StartTask\(\)](#).

6.136.3 Member Function Documentation

6.136.3.1 `void dng_sniffer_task::Sniff ()` `[inline]`

Check for pending user cancellation or other abort. [ThrowUserCanceled](#) will be called if one is pending.

References [dng_abort_sniffer::SniffForAbort\(\)](#).

6.136.3.2 `void dng_sniffer_task::UpdateProgress (real64 fract)` `[inline]`

Update progress on this subtask.

Parameters

<i>fract</i>	Percentage of processing completed on current task, from 0.0 to 1.0 .
--------------	---

References [dng_abort_sniffer::UpdateProgress\(\)](#).

Referenced by [Finish\(\)](#), and [UpdateProgress\(\)](#).

6.136.3.3 `void dng_sniffer_task::UpdateProgress (uint32 done, uint32 total)` `[inline]`

Update progress on this subtask.

Parameters

<i>done</i>	Amount of task completed in arbitrary integer units.
<i>total</i>	Total size of task in same arbitrary integer units as done.

References `UpdateProgress()`.

- [dng_abort_sniffer.h](#)

6.137 dng_space_AdobeRGB Class Reference

Singleton class for AdobeRGB color space.

```
#include <dng_color_space.h>
```

Inheritance diagram for `dng_space_AdobeRGB`:

Public Member Functions

- virtual const [dng_1d_function](#) & [GammaFunction](#) () const
Returns [dng_function_GammaEncode_1_8](#).
- virtual bool [ICCProfile](#) (uint32 &size, const uint8 *&data) const
Returns AdobeRGB (1998) ICC profile.

Static Public Member Functions

- static const [dng_color_space](#) & [Get](#) ()
Static method for getting single global instance of this color space.

Additional Inherited Members

6.137.1 Detailed Description

Singleton class for AdobeRGB color space.

The documentation for this class was generated from the following files:

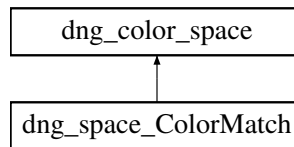

- [dng_color_space.h](#)
- [dng_color_space.cpp](#)

6.138 dng_space_ColorMatch Class Reference

Singleton class for ColorMatch color space.

```
#include <dng_color_space.h>
```

Inheritance diagram for dng_space_ColorMatch:

Public Member Functions

- virtual const [dng_1d_function](#) & [GammaFunction](#) () const
Returns [dng_function_GammaEncode_1_8](#).
- virtual bool [ICCPProfile](#) (uint32 &size, const uint8 *&data) const
Returns ColorMatch RGB ICC profile.

Static Public Member Functions

- static const [dng_color_space](#) & [Get](#) ()
Static method for getting single global instance of this color space.

Additional Inherited Members

6.138.1 Detailed Description

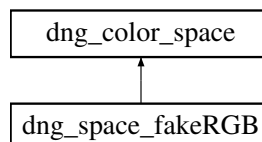

Singleton class for ColorMatch color space.

The documentation for this class was generated from the following files:

- [dng_color_space.h](#)
- [dng_color_space.cpp](#)

6.139 dng_space_fakeRGB Class Reference

Inheritance diagram for dng_space_fakeRGB:

Static Public Member Functions

- static const [dng_color_space](#) & [Get](#) ()

Additional Inherited Members

The documentation for this class was generated from the following files:

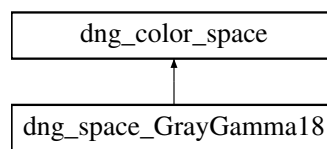

- [dng_color_space.h](#)
- [dng_color_space.cpp](#)

6.140 dng_space_GrayGamma18 Class Reference

Singleton class for gamma 1.8 grayscale color space.

```
#include <dng_color_space.h>
```

Inheritance diagram for dng_space_GrayGamma18:

Public Member Functions

- virtual const [dng_1d_function](#) & [GammaFunction](#) () const
Returns [dng_function_GammaEncode_1_8](#).
- virtual bool [ICCProfile](#) (uint32 &size, const uint8 *&data) const
Returns simple grayscale gamma 1.8 ICC profile.

Static Public Member Functions

- static const [dng_color_space](#) & [Get](#) ()
Static method for getting single global instance of this color space.

Additional Inherited Members

6.140.1 Detailed Description

Singleton class for gamma 1.8 grayscale color space.

The documentation for this class was generated from the following files:

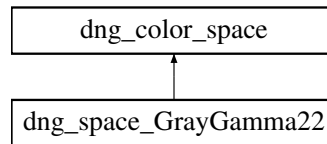

- [dng_color_space.h](#)
- [dng_color_space.cpp](#)

6.141 dng_space_GrayGamma22 Class Reference

Singleton class for gamma 2.2 grayscale color space.

```
#include <dng_color_space.h>
```

Inheritance diagram for dng_space_GrayGamma22:

Public Member Functions

- virtual const [dng_1d_function & GammaFunction](#) () const
Returns [dng_function_GammaEncode_2_2](#).
- virtual bool [ICCPProfile](#) (uint32 &size, const uint8 *&data) const
Returns simple grayscale gamma 2.2 ICC profile.

Static Public Member Functions

- static const [dng_color_space & Get](#) ()
Static method for getting single global instance of this color space.

Additional Inherited Members

6.141.1 Detailed Description

Singleton class for gamma 2.2 grayscale color space.

The documentation for this class was generated from the following files:

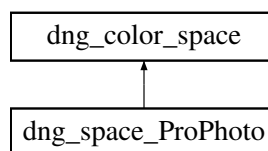

- [dng_color_space.h](#)
- [dng_color_space.cpp](#)

6.142 dng_space_ProPhoto Class Reference

Singleton class for ProPhoto RGB color space.

```
#include <dng_color_space.h>
```

Inheritance diagram for dng_space_ProPhoto:

Public Member Functions

- virtual const [dng_1d_function & GammaFunction](#) () const
Returns [dng_function_GammaEncode_1_8](#).
- virtual bool [ICCPProfile](#) (uint32 &size, const uint8 *&data) const
Returns ProPhoto RGB ICC profile.

Static Public Member Functions

- static const [dng_color_space](#) & [Get](#) ()
Static method for getting single global instance of this color space.

Additional Inherited Members

6.142.1 Detailed Description

Singleton class for ProPhoto RGB color space.

The documentation for this class was generated from the following files:

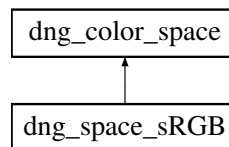

- [dng_color_space.h](#)
- [dng_color_space.cpp](#)

6.143 dng_space_sRGB Class Reference

Singleton class for sRGB color space.

```
#include <dng_color_space.h>
```

Inheritance diagram for dng_space_sRGB:

Public Member Functions

- virtual const [dng_1d_function](#) & [GammaFunction](#) () const
Returns [dng_function_GammaEncode_sRGB](#).
- virtual bool [ICCProfile](#) (uint32 &size, const uint8 *&data) const
Returns sRGB IEC61966-2.1 ICC profile.

Static Public Member Functions

- static const [dng_color_space](#) & [Get](#) ()
Static method for getting single global instance of this color space.

Additional Inherited Members

6.143.1 Detailed Description

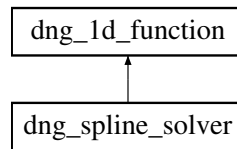

Singleton class for sRGB color space.

The documentation for this class was generated from the following files:

- [dng_color_space.h](#)
- [dng_color_space.cpp](#)

6.144 dng_spline_solver Class Reference

Inheritance diagram for dng_spline_solver:

Public Member Functions

- void **Reset** ()
- void **Add** (real64 x, real64 y)
- virtual void **Solve** ()
- virtual bool **IsIdentity** () const
Returns true if this function is the map $x \rightarrow y$ such that $x == y$ for all x . That is if $Evaluate(x) == x$ for all x .
- virtual real64 **Evaluate** (real64 x) const

Protected Attributes

- std::vector< real64 > **X**
- std::vector< real64 > **Y**
- std::vector< real64 > **S**

6.144.1 Member Function Documentation

6.144.1.1 real64 dng_spline_solver::Evaluate (real64 x) const [virtual]

Return the mapping for value x. This method must be implemented by a derived class of [dng_1d_function](#) and the derived class determines the lookup method and function used.

Parameters

x	A value between 0.0 and 1.0 (inclusive).
---	--

Return values

<i>Mapped</i>	value for x
---------------	-------------

Implements [dng_1d_function](#).

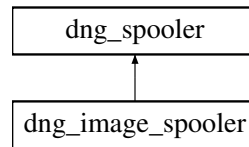

References `DNG_ASSERT`.

The documentation for this class was generated from the following files:

- dng_spline.h
- dng_spline.cpp

6.145 dng_spooler Class Reference

Inheritance diagram for dng_spooler:

Public Member Functions

- virtual void **Spool** (const void *data, uint32 count)=0

The documentation for this class was generated from the following file:

- [dng_lossless_jpeg.h](#)

6.146 dng_srational Class Reference

Public Member Functions

- **dng_srational** (int32 nn, int32 dd)
- void **Clear** ()
- bool **IsValid** () const
- bool **NotValid** () const
- bool **operator==** (const [dng_srational](#) &r) const
- bool **operator!=** (const [dng_srational](#) &r) const
- real64 **As_real64** () const
- void **Set_real64** (real64 x, int32 dd=0)
- void **ReduceByFactor** (int32 factor)

Public Attributes

- int32 **n**
- int32 **d**

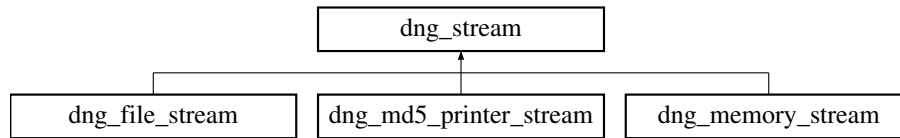

The documentation for this class was generated from the following files:

- [dng_rational.h](#)
- [dng_rational.cpp](#)

6.147 dng_stream Class Reference

```
#include <dng_stream.h>
```

Inheritance diagram for dng_stream:

Public Types

- enum { **kSmallBufferSize** = 4 * 1024, **kBigBufferSize** = 64 * 1024, **kDefaultBufferSize** = kSmallBufferSize }

Public Member Functions

- [dng_stream](#) (const void *data, uint32 count, uint64 offsetInOriginalFile=kDNGStreamInvalidOffset)
- bool [SwapBytes](#) () const
- void [SetSwapBytes](#) (bool swapBytes)
- bool [BigEndian](#) () const
- void [SetBigEndian](#) (bool bigEndian=true)
- bool [LittleEndian](#) () const
- void [SetLittleEndian](#) (bool littleEndian=true)
- uint32 [BufferSize](#) () const

Returns the size of the buffer used by the stream.

- uint64 [Length](#) ()
- uint64 [Position](#) () const
- uint64 [PositionInOriginalFile](#) () const
- uint64 [OffsetInOriginalFile](#) () const
- const void * [Data](#) () const
- [dng_memory_block](#) * [AsMemoryBlock](#) ([dng_memory_allocator](#) &allocator)
- void [SetReadPosition](#) (uint64 offset)

Seek to a new position in stream for reading.

- void [Skip](#) (uint64 delta)
- void [Get](#) (void *data, uint32 count)
- void [SetWritePosition](#) (uint64 offset)

Seek to a new position in stream for writing.

- void [Flush](#) ()

Force any stored data in stream to be written to underlying storage.

- void [SetLength](#) (uint64 length)
- void [Put](#) (const void *data, uint32 count)
- uint8 [Get_uint8](#) ()
- void [Put_uint8](#) (uint8 x)

- virtual void [CopyToStream](#) ([dng_stream](#) &dstStream, uint64 count)
- void [DuplicateStream](#) ([dng_stream](#) &dstStream)

Protected Member Functions

- **dng_stream** ([dng_abort_sniffer](#) *sniffer=NULL, uint32 bufferSize=kDefaultBufferSize, uint64 offsetInOriginalFile=kDNGStreamInvalidOffset)
- virtual uint64 **DoGetLength** ()
- virtual void **DoRead** (void *data, uint32 count, uint64 offset)
- virtual void **DoSetLength** (uint64 length)
- virtual void **DoWrite** (const void *data, uint32 count, uint64 offset)

6.147.1 Detailed Description

Base stream abstraction. Has support for going between stream and pointer abstraction.

6.147.2 Constructor & Destructor Documentation

6.147.2.1 [dng_stream::dng_stream](#) (const void * data, uint32 count, uint64 offsetInOriginalFile = kDNGStreamInvalidOffset)

Construct a stream with initial data.

Parameters

<i>data</i>	Pointer to initial contents of stream.
<i>count</i>	Number of bytes data is valid for.
<i>offsetInOriginalFile</i>	If data came from a file originally, offset can be saved here for later use.

6.147.3 Member Function Documentation

6.147.3.1 dng_memory_block * dng_stream::AsMemoryBlock (dng_memory_allocator & allocator)

Return the entire stream as a single memory block. This works for all streams, but requires copying the data to a new buffer.

Parameters

<i>allocator</i>	Allocator used to allocate memory.
------------------	------------------------------------

References dng_memory_allocator::Allocate(), Flush(), Get(), Length(), SetReadPosition(), and ThrowProgramError().

Referenced by dng_iptc::Spool().

6.147.3.2 bool dng_stream::BigEndian () const

Getter for whether data in stream is big endian.

Return values

<i>If</i>	true, data in stream is big endian.
-----------	-------------------------------------

Referenced by LittleEndian(), and dng_image_writer::WriteDNG().

6.147.3.3 void dng_stream::CopyToStream (dng_stream & dstStream, uint64 count) [virtual]

Copy a specified number of bytes to a target stream.

Parameters

<i>dstStream</i>	The target stream.
<i>count</i>	The number of bytes to copy.

Reimplemented in [dng_memory_stream](#).

References dng_memory_data::Buffer(), Get(), and Put().

Referenced by DuplicateStream().

6.147.3.4 const void * dng_stream::Data () const

Return pointer to stream contents if the stream is entirely available as a single memory block, NULL otherwise.

6.147.3.5 void dng_stream::DuplicateStream (dng_stream & dstStream)

Makes the target stream a copy of this stream.

Parameters

<i>dstStream</i>	The target stream.
------------------	--------------------

References CopyToStream(), Flush(), Length(), SetLength(), SetReadPosition(), and SetWritePosition().

6.147.3.6 void dng_stream::Get (void * data, uint32 count)

Get data from stream. Exception is thrown and no data is read if insufficient data available in stream.

Parameters

<i>data</i>	Buffer to put data into. Must be valid for count bytes.
<i>count</i>	Bytes of data to read.

Exceptions

dng_exception	with <code>fErrorCode</code> equal to <code>dng_error_end_of_file</code> if not enough data in stream.
-------------------------------	--

References `Flush()`, `Length()`, `dng_abort_sniffer::SniffForAbort()`, and `ThrowEndOfFile()`.

Referenced by `AsMemoryBlock()`, `CopyToStream()`, `Get_real64()`, `Get_uint16()`, `Get_uint32()`, `Get_uint64()`, `Get_uint8()`, `dng_iphc::Parse()`, `dng_read_tiles_task::Process()`, and `dng_read_image::Read()`.

6.147.3.7 void dng_stream::Get_CString (char * data, uint32 maxLength)

Get an 8-bit character string from stream and advance read position. Routine always reads until a NUL character (8-bits of zero) is read. (That is, only `maxLength` bytes will be returned in buffer, but the stream is always advanced until a NUL is read or EOF is reached.)

Parameters

<i>data</i>	Buffer in which string is returned.
<i>maxLength</i>	Maximum number of bytes to place in buffer.

Exceptions

dng_exception	with <code>fErrorCode</code> equal to <code>dng_error_end_of_file</code> if stream runs out before NUL is seen.
-------------------------------	---

References `Get_uint8()`.

6.147.3.8 int16 dng_stream::Get_int16 () [inline]

Get one 16-bit integer from stream and advance read position. Byte swap if byte swapping is turned on.

Return values

<i>One</i>	16-bit integer.
------------	-----------------

Exceptions

dng_exception	with <code>fErrorCode</code> equal to <code>dng_error_end_of_file</code> if not enough data in stream.
-------------------------------	--

References `Get_uint16()`.

Referenced by `TagValue_int32()`.

6.147.3.9 int32 dng_stream::Get_int32 () [inline]

Get one 32-bit integer from stream and advance read position. Byte swap if byte swapping is turned on.

Return values

<i>One</i>	32-bit integer.
------------	-----------------

Exceptions

dng_exception	with fErrorCode equal to dng_error_end_of_file if not enough data in stream.
-------------------------------	--

References `Get_uint32()`.

Referenced by `dng_area_spec::GetData()`, `TagValue_int32()`, `TagValue_real64()`, `TagValue_srational()`, and `TagValue_urational()`.

6.147.3.10 `int64 dng_stream::Get_int64 () [inline]`

Get one 64-bit integer from stream and advance read position. Byte swap if byte swapping is turned on.

Return values

<i>One</i>	64-bit integer.
------------	-----------------

Exceptions

dng_exception	with fErrorCode equal to dng_error_end_of_file if not enough data in stream.
-------------------------------	--

References `Get_uint64()`.

6.147.3.11 `int8 dng_stream::Get_int8 () [inline]`

Get one 8-bit integer from stream and advance read position.

Return values

<i>One</i>	8-bit integer.
------------	----------------

Exceptions

dng_exception	with fErrorCode equal to dng_error_end_of_file if not enough data in stream.
-------------------------------	--

References `Get_uint8()`.

Referenced by `dng_iptc::Parse()`, and `TagValue_int32()`.

6.147.3.12 `real32 dng_stream::Get_real32 ()`

Get one 32-bit IEEE floating-point number from stream and advance read position. Byte swap if byte swapping is turned on.

Return values

<i>One</i>	32-bit IEEE floating-point number.
------------	------------------------------------

Exceptions

dng_exception	with fErrorCode equal to dng_error_end_of_file if not enough data in stream.
-------------------------------	--

References `Get_uint32()`.

Referenced by `dng_gain_map::GetStream()`, `dng_camera_profile::Parse()`, and `TagValue_real64()`.

6.147.3.13 real64 dng_stream::Get_real64 ()

Get one 64-bit IEEE floating-point number from stream and advance read position. Byte swap if byte swapping is turned on.

Return values

<i>One</i>	64-bit IEEE floating-point number .
------------	-------------------------------------

Exceptions

dng_exception	with fErrorCode equal to dng_error_end_of_file if not enough data in stream.
-------------------------------	--

References Get(), and Get_uint32().

Referenced by dng_gain_map::GetStream(), and TagValue_real64().

6.147.3.14 uint16 dng_stream::Get_uint16 ()

Get an unsigned 16-bit integer from stream and advance read position. Byte swap if byte swapping is turned on.

Return values

<i>One</i>	unsigned 16-bit integer.
------------	--------------------------

Exceptions

dng_exception	with fErrorCode equal to dng_error_end_of_file if not enough data in stream.
-------------------------------	--

References Get().

Referenced by Get_int16(), Get_UString(), dng_info::Parse(), dng_iptc::Parse(), and TagValue_uint32().

6.147.3.15 uint32 dng_stream::Get_uint32 ()

Get an unsigned 32-bit integer from stream and advance read position. Byte swap if byte swapping is turned on.

Return values

<i>One</i>	unsigned 32-bit integer.
------------	--------------------------

Exceptions

dng_exception	with fErrorCode equal to dng_error_end_of_file if not enough data in stream.
-------------------------------	--

References Get().

Referenced by dng_opcode_GainMap::dng_opcode_GainMap(), Get_int32(), Get_real32(), Get_real64(), Get_uint64(), dng_area_spec::GetData(), dng_gain_map::GetStream(), dng_info::Parse(), dng_opcode_list::Parse(), TagValue_real64(), TagValue_uint32(), and TagValue_urational().

6.147.3.16 uint64 dng_stream::Get_uint64 ()

Get an unsigned 64-bit integer from stream and advance read position. Byte swap if byte swapping is turned on.

Return values

<i>One</i>	unsigned 64-bit integer.
------------	--------------------------

Exceptions

dng_exception	with fErrorCode equal to dng_error_end_of_file if not enough data in stream.
-------------------------------	--

References Get(), and Get_uint32().

Referenced by Get_int64().

6.147.3.17 uint8 dng_stream::Get_uint8 () [inline]

Get an unsigned 8-bit integer from stream and advance read position.

Return values

<i>One</i>	unsigned 8-bit integer.
------------	-------------------------

Exceptions

dng_exception	with fErrorCode equal to dng_error_end_of_file if not enough data in stream.
-------------------------------	--

References Get().

Referenced by Get_CString(), Get_int8(), dng_iptc::Parse(), and TagValue_uint32().

6.147.3.18 void dng_stream::Get_UString (char * data, uint32 maxLength)

Get a 16-bit character string from stream and advance read position. 16-bit characters are truncated to 8-bits. Routine always reads until a NUL character (16-bits of zero) is read. (That is, only maxLength bytes will be returned in buffer, but the stream is always advanced until a NUL is read or EOF is reached.)

Parameters

<i>data</i>	Buffer to place string in.
<i>maxLength</i>	Maximum number of bytes to place in buffer.

Exceptions

dng_exception	with fErrorCode equal to dng_error_end_of_file if stream runs out before NUL is seen.
-------------------------------	---

References Get_uint16().

6.147.3.19 uint64 dng_stream::Length () [inline]

Getter for length of data in stream.

Return values

<i>Length</i>	of readable data in stream.
---------------	-----------------------------

Referenced by AsMemoryBlock(), dng_memory_stream::CopyToStream(), DuplicateStream(), Get(), dng_info::Parse(), dng_iptc::Parse(), Put(), Put_uint8(), dng_read_image::Read(), SetLength(), SetReadPosition(), dng_iptc::Spool(), and dng_image_writer::WriteDNG().

6.147.3.20 `bool dng_stream::LittleEndian () const [inline]`

Getter for whether data in stream is big endian.

Return values

<i>If</i>	true, data in stream is big endian.
-----------	-------------------------------------

References BigEndian().

Referenced by dng_read_tiles_task::Process(), and dng_write_tiles_task::Process().

6.147.3.21 `uint64 dng_stream::OffsetInOriginalFile () const`

Getter for offset in original file.

Return values

<i>kInvalidOffset</i>	if no offset in original file is set, offset in original file otherwise.
-----------------------	--

6.147.3.22 `uint64 dng_stream::Position () const [inline]`

Getter for current offset in stream.

Return values

<i>current</i>	offset from start of stream.
----------------	------------------------------

Referenced by dng_memory_stream::CopyToStream(), dng_opcode_GainMap::dng_opcode_GainMap(), PadAlign2(), PadAlign4(), dng_info::Parse(), dng_iptc::Parse(), dng_opcode_list::Parse(), PositionInOriginalFile(), dng_write_tiles_task::Process(), Skip(), and dng_image_writer::WriteDNG().

6.147.3.23 `uint64 dng_stream::PositionInOriginalFile () const`

Getter for current position in original file, taking into account OffsetInOriginalFile stream data was taken from.

Return values

<i>kInvalidOffset</i>	if no offset in original file is set, sum of offset in original file and current position otherwise.
-----------------------	--

References Position().

Referenced by dng_info::Parse().

6.147.3.24 `void dng_stream::Put (const void * data, uint32 count)`

Write data to stream.

Parameters

<i>data</i>	Buffer of data to write to stream.
<i>count</i>	Bytes of in data.

References Flush(), Length(), and dng_abort_sniffer::SniffForAbort().

Referenced by dng_memory_stream::CopyToStream(), CopyToStream(), Put_real32(), Put_real64(), Put_uint16(), Put_uint32(), Put_uint64(), Put_uint8(), dng_opcode_Unknown::PutData(), PutZeros(), dng_iptc::Spool(), and dng_image_writer::WriteDNG().

6.147.3.25 `void dng_stream::Put_int16 (int16 x) [inline]`

Put one 16-bit integer to stream and advance write position. Byte swap if byte swapping is turned on.

Parameters

<code>x</code>	One 16-bit integer.
----------------	---------------------

References `Put_uint16()`.

6.147.3.26 `void dng_stream::Put_int32 (int32 x) [inline]`

Put one 32-bit integer to stream and advance write position. Byte swap if byte swapping is turned on.

Parameters

<code>x</code>	One 32-bit integer.
----------------	---------------------

References `Put_uint32()`.

Referenced by `dng_opcode_TrimBounds::PutData()`, `dng_area_spec::PutData()`, and `dng_opcode_FixBadPixelsList::PutData()`.

6.147.3.27 `void dng_stream::Put_int64 (int64 x) [inline]`

Put one 64-bit integer to stream and advance write position. Byte swap if byte swapping is turned on.

Parameters

<code>x</code>	One 64-bit integer.
----------------	---------------------

References `Put_uint64()`.

6.147.3.28 `void dng_stream::Put_int8 (int8 x) [inline]`

Put one 8-bit integer to stream and advance write position.

Parameters

<code>x</code>	One 8-bit integer.
----------------	--------------------

References `Put_uint8()`.

6.147.3.29 `void dng_stream::Put_real32 (real32 x)`

Put one 32-bit IEEE floating-point number to stream and advance write position. Byte swap if byte swapping is turned on.

Parameters

<code>x</code>	One 32-bit IEEE floating-point number.
----------------	--

References `Put()`, and `Put_uint32()`.

Referenced by `dng_opcode_DeltaPerRow::PutData()`, `dng_opcode_DeltaPerColumn::PutData()`, `dng_opcode_ScalePerRow::PutData()`, `dng_opcode_ScalePerColumn::PutData()`, and `dng_gain_map::PutStream()`.

6.147.3.30 void dng_stream::Put_real64 (real64 x)

Put one 64-bit IEEE floating-point number to stream and advance write position. Byte swap if byte swapping is turned on.

Parameters

x	One64-bit IEEE floating-point number.
---	---------------------------------------

References Put(), and Put_uint32().

Referenced by dng_opcode_MapPolynomial::PutData(), dng_opcode_WarpRectilinear::PutData(), dng_opcode_WarpFisheye::PutData(), dng_opcode_FixVignetteRadial::PutData(), and dng_gain_map::PutStream().

6.147.3.31 void dng_stream::Put_uint16 (uint16 x)

Put an unsigned 16-bit integer to stream and advance write position. Byte swap if byte swapping is turned on.

Parameters

x	One unsigned 16-bit integer.
---	------------------------------

References Put().

Referenced by Put_int16(), dng_opcode_MapTable::PutData(), dng_iptc::Spool(), and dng_image_writer::WriteDNG().

6.147.3.32 void dng_stream::Put_uint32 (uint32 x)

Put an unsigned 32-bit integer to stream and advance write position. Byte swap if byte swapping is turned on.

Parameters

x	One unsigned 32-bit integer.
---	------------------------------

References Put().

Referenced by dng_opcode_list::FingerprintToStream(), Put_int32(), Put_real32(), Put_real64(), Put_uint64(), dng_opcode_TrimBounds::PutData(), dng_opcode_FixBadPixelsConstant::PutData(), dng_area_spec::PutData(), dng_opcode_MapTable::PutData(), dng_opcode_GainMap::PutData(), dng_opcode::PutData(), dng_opcode_MapPolynomial::PutData(), dng_opcode_Unknown::PutData(), dng_opcode_FixBadPixelsList::PutData(), dng_opcode_DeltaPerRow::PutData(), dng_opcode_DeltaPerColumn::PutData(), dng_opcode_ScalePerRow::PutData(), dng_opcode_ScalePerColumn::PutData(), dng_opcode_WarpRectilinear::PutData(), dng_opcode_WarpFisheye::PutData(), dng_opcode_FixVignetteRadial::PutData(), dng_gain_map::PutStream(), and dng_image_writer::WriteDNG().

6.147.3.33 void dng_stream::Put_uint64 (uint64 x)

Put an unsigned 64-bit integer to stream and advance write position. Byte swap if byte swapping is turned on.

Parameters

x	One unsigned 64-bit integer.
---	------------------------------

References Put(), and Put_uint32().

Referenced by Put_int64().

6.147.3.34 `void dng_stream::Put_uint8 (uint8 x) [inline]`

Put an unsigned 8-bit integer to stream and advance write position.

Parameters

<i>x</i>	One unsigned 8-bit integer.
----------	-----------------------------

References `Length()`, and `Put()`.

Referenced by `dng_write_tiles_task::Process()`, `Put_int8()`, `PutZeros()`, `dng_iptc::Spool()`, and `dng_image_writer::WriteDNG()`.

6.147.3.35 `void dng_stream::PutZeros (uint64 count)`

Writes the specified number of zero bytes to stream.

Parameters

<i>count</i>	Number of zero bytes to write.
--------------	--------------------------------

References `dng_memory_data::Buffer()`, `Put()`, and `Put_uint8()`.

Referenced by `PadAlign2()`, and `PadAlign4()`.

6.147.3.36 `void dng_stream::SetBigEndian (bool bigEndian = true)`

Setter for whether data in stream is big endian.

Parameters

<i>bigEndian</i>	If true, data in stream is big endian.
------------------	--

Referenced by `dng_info::Parse()`, `dng_iptc::Parse()`, `SetLittleEndian()`, `dng_opcode_list::Spool()`, and `dng_iptc::Spool()`.

6.147.3.37 `void dng_stream::SetLength (uint64 length)`

Set length of available data.

Parameters

<i>length</i>	Number of bytes of avialbe data in stream.
---------------	--

References `Flush()`, and `Length()`.

Referenced by `DuplicateStream()`, and `dng_image_writer::WriteDNG()`.

6.147.3.38 `void dng_stream::SetLittleEndian (bool littleEndian = true) [inline]`

Setter for whether data in stream is big endian.

Parameters

<i>littleEndian</i>	If true, data in stream is big endian.
---------------------	--

References `SetBigEndian()`.

Referenced by `dng_info::Parse()`, `dng_read_tiles_task::Process()`, and `dng_write_tiles_task::Process()`.

6.147.3.39 void dng_stream::SetSniffer (dng_abort_sniffer * *sniffer*) [inline]

Setter for sniffer associated with stream.

Parameters

<i>sniffer</i>	The new sniffer to use (or NULL for none).
----------------	--

6.147.3.40 void dng_stream::SetSwapBytes (bool *swapBytes*) [inline]

Setter for whether stream is swapping byte order on input/output.

Parameters

<i>swapBytes</i>	If true, stream will swap byte order on input or output for future reads/writes.
------------------	--

6.147.3.41 void dng_stream::Skip (uint64 *delta*) [inline]

Skip forward in stream.

Parameters

<i>delta</i>	Number of bytes to skip forward.
--------------	----------------------------------

References Position(), and SetReadPosition().

6.147.3.42 dng_abort_sniffer* dng_stream::Sniffer () const [inline]

Getter for sniffer associated with stream.

Return values

<i>The</i>	sniffer for this stream.
------------	--------------------------

6.147.3.43 bool dng_stream::SwapBytes () const [inline]

Getter for whether stream is swapping byte order on input/output.

Return values

<i>If</i>	true, data will be swapped on input/output.
-----------	---

6.147.3.44 int32 dng_stream::TagValue_int32 (uint32 *tagType*)

Get a value of size indicated by tag type from stream and advance read position. Byte swap if byte swapping is turned on and tag type is larger than a byte. Value is returned as a 32-bit integer.

Parameters

<i>tagType</i>	Tag type of data stored in stream.
----------------	------------------------------------

Return values

<i>One</i>	32-bit integer.
------------	-----------------

Exceptions

dng_exception	with fErrorCode equal to dng_error_end_of_file if not enough data in stream.
-------------------------------	--

References Get_int16(), Get_int32(), Get_int8(), and TagValue_real64().

Referenced by TagValue_real64(), and TagValue_urational().

6.147.3.45 real64 dng_stream::TagValue_real64 (uint32 tagType)

Get a value of size indicated by tag type from stream and advance read position. Byte swap if byte swapping is turned on and tag type is larger than a byte. Value is returned as a 64-bit IEEE floating-point number.

Parameters

<i>tagType</i>	Tag type of data stored in stream.
----------------	------------------------------------

Return values

<i>One</i>	64-bit IEEE floating-point number.
------------	------------------------------------

Exceptions

dng_exception	with fErrorCode equal to dng_error_end_of_file if not enough data in stream.
-------------------------------	--

References Get_int32(), Get_real32(), Get_real64(), Get_uint32(), TagValue_int32(), and TagValue_uint32().

Referenced by TagValue_int32(), TagValue_srational(), TagValue_uint32(), and TagValue_urational().

6.147.3.46 dng_srational dng_stream::TagValue_srational (uint32 tagType)

Get a value of size indicated by tag type from stream and advance read position. Byte swap if byte swapping is turned on and tag type is larger than a byte. Value is returned as a [dng_srational](#).

Parameters

<i>tagType</i>	Tag type of data stored in stream.
----------------	------------------------------------

Return values

<i>One</i>	dng_srational .
------------	---------------------------------

Exceptions

dng_exception	with fErrorCode equal to dng_error_end_of_file if not enough data in stream.
-------------------------------	--

References Get_int32(), and TagValue_real64().

6.147.3.47 uint32 dng_stream::TagValue_uint32 (uint32 tagType)

Get a value of size indicated by tag type from stream and advance read position. Byte swap if byte swapping is turned on and tag type is larger than a byte. Value is returned as an unsigned 32-bit integer.

Parameters

<i>tagType</i>	Tag type of data stored in stream.
----------------	------------------------------------

Return values

<i>One</i>	unsigned 32-bit integer.
------------	--------------------------

Exceptions

dng_exception	with fErrorCode equal to dng_error_end_of_file if not enough data in stream.
-------------------------------	--

References `Get_uint16()`, `Get_uint32()`, `Get_uint8()`, and `TagValue_real64()`.

Referenced by `dng_read_image::Read()`, `TagValue_real64()`, and `TagValue_urational()`.

6.147.3.48 dng_urational dng_stream::TagValue_urational (uint32 tagType)

Get a value of size indicated by tag type from stream and advance read position. Byte swap if byte swapping is turned on and tag type is larger than a byte. Value is returned as a [dng_urational](#).

Parameters

<i>tagType</i>	Tag type of data stored in stream.
----------------	------------------------------------

Return values

<i>One</i>	dng_urational .
------------	---------------------------------

Exceptions

dng_exception	with fErrorCode equal to dng_error_end_of_file if not enough data in stream.
-------------------------------	--

References `Get_int32()`, `Get_uint32()`, `TagValue_int32()`, `TagValue_real64()`, and `TagValue_uint32()`.

6.153.1 Detailed Description

Class to get resource acquisition is instantiation behavior for tile buffers. Can be dirty or constant tile access.

6.153.2 Constructor & Destructor Documentation

6.153.2.1 dng_tile_buffer::dng_tile_buffer (const dng_image & image, const dng_rect & tile, bool dirty) [protected]

Obtain a tile from an image.

Parameters

<i>image</i>	Image tile will come from.
<i>tile</i>	Rectangle denoting extent of tile.
<i>dirty</i>	Flag indicating whether this is read-only or read-write access.

The documentation for this class was generated from the following files:

- [dng_image.h](#)

6.166.1 Detailed Description

Abstract base class holding common warp opcode parameters (e.g., number of planes, optical center) and common warp routines.

6.166.2 Constructor & Destructor Documentation

6.166.2.1 dng_warp_params::dng_warp_params (uint32 *planes*, const dng_point_real64 & *fCenter*)

Create warp parameters with specified number of planes and image center.

Parameters

<i>planes</i>	The number of planes of parameters specified: It must be either 1 or equal to the number of planes of the image to be processed.
<i>fCenter</i>	The image center in relative coordinates.

References DNG_ASSERT, and kMaxColorPlanes.

6.166.3 Member Function Documentation

6.166.3.1 virtual real64 dng_warp_params::Evaluate (uint32 *plane*, real64 *r*) const [pure virtual]

Evaluate the 1D radial warp function for the specified plane. Parameter *r* is the destination (i.e., corrected) normalized radius, i.e., the normalized Euclidean distance between a corrected pixel position and the optical center in the image. *r* lies in the range [0,1]. The returned result is non-negative.

Implemented in [dng_warp_params_fisheye](#), and [dng_warp_params_rectilinear](#).

Referenced by EvaluateInverse().

6.166.3.2 real64 dng_warp_params::EvaluateInverse (uint32 *plane*, real64 *r*) const [virtual]

Compute and return the inverse of Evaluate () above. The base implementation uses Newton's method to perform the inversion. Parameter *r* is the source (i.e., uncorrected) normalized radius, i.e., normalized Euclidean distance between a corrected pixel position and the optical center in the image. Both *r* and the computed result are non-negative.

References Evaluate().

6.166.3.3 virtual real64 dng_warp_params::EvaluateRatio (uint32 *plane*, real64 *r2*) const [pure virtual]

Evaluate the 1D radial warp ratio function for the specified plane. Parameter *r2* is the square of the destination (i.e., corrected) normalized radius, i.e., the square of the normalized Euclidean distance between a corrected pixel position and the optical center in the image. *r2* must lie in the range [0,1]. Note that this is different than the Evaluate () function, above, in that the argument to EvaluateRatio () is the square of the radius, not the radius itself. The returned result is non-negative. Mathematically, EvaluateRatio ($r * r$) is the same as Evaluate (*r*) / *r*.

Implemented in [dng_warp_params_fisheye](#), and [dng_warp_params_rectilinear](#).

6.166.3.4 virtual dng_point_real64 dng_warp_params::EvaluateTangential (uint32 *plane*, real64 *r2*, const dng_point_real64 & *diff*, const dng_point_real64 & *diff2*) const [pure virtual]

Evaluate the 2D tangential warp for the specified plane. Parameter *r2* is the square of the destination (i.e., corrected) normalized radius, i.e., the square of the normalized Euclidean distance between a corrected pixel position *P* and the optical center in the image. *r2* must lie in the range [0,1]. *diff* contains the vertical and horizontal Euclidean distances (in pixels) between *P* and the optical center. *diff2* contains the squares of the vertical and horizontal Euclidean distances (in pixels) between *P* and the optical center. The returned result is the tangential warp offset, measured in pixels.

Implemented in [dng_warp_params_fisheye](#), and [dng_warp_params_rectilinear](#).

Referenced by EvaluateTangential2(), and EvaluateTangential3().

6.166.3.5 dng_point_real64 dng_warp_params::EvaluateTangential2 (uint32 plane, const dng_point_real64 & diff) const

Evaluate the 2D tangential warp for the specified plane. diff contains the vertical and horizontal Euclidean distances (in pixels) between the destination (i.e., corrected) pixel position and the optical center in the image. The returned result is the tangential warp offset, measured in pixels.

References EvaluateTangential().

Referenced by dng_warp_params_rectilinear::MaxSrcTanGap().

6.166.3.6 dng_point_real64 dng_warp_params::EvaluateTangential3 (uint32 plane, real64 r2, const dng_point_real64 & diff) const

Evaluate the 2D tangential warp for the specified plane. Parameter r2 is the square of the destination (i.e., corrected) normalized radius, i.e., the square of the normalized Euclidean distance between a corrected pixel position P and the optical center in the image. r2 must lie in the range [0,1]. diff contains the vertical and horizontal Euclidean distances (in pixels) between P and the optical center. The returned result is the tangential warp offset, measured in pixels.

References EvaluateTangential().

6.166.3.7 virtual real64 dng_warp_params::MaxSrcRadiusGap (real64 maxDstGap) const [pure virtual]

Compute and return the maximum warped radius gap. Let D be a rectangle in a destination (corrected) image. Let rDstFar and rDstNear be the farthest and nearest points to the image center, respectively. Then the specified parameter maxDstGap is the Euclidean distance between rDstFar and rDstNear. Warp D through this warp function to a closed and bounded (generally not rectangular) region S. Let rSrcFar and rSrcNear be the farthest and nearest points to the image center, respectively. This routine returns a value that is at least (rSrcFar - rSrcNear).

Implemented in [dng_warp_params_fisheye](#), and [dng_warp_params_rectilinear](#).

Referenced by dng_filter_warp::SrcTileSize().

6.166.3.8 virtual dng_point_real64 dng_warp_params::MaxSrcTanGap (dng_point_real64 minDst, dng_point_real64 maxDst) const [pure virtual]

Compute and return the maximum warped tangential gap. minDst is the top-left pixel of the image in normalized pixel coordinates. maxDst is the bottom-right pixel of the image in normalized pixel coordinates. MaxSrcTanGap () computes the maximum absolute shift in normalized pixels in the horizontal and vertical directions that can occur as a result of the tangential warp.

Implemented in [dng_warp_params_fisheye](#), and [dng_warp_params_rectilinear](#).

Referenced by dng_filter_warp::SrcTileSize().

The documentation for this class was generated from the following files:

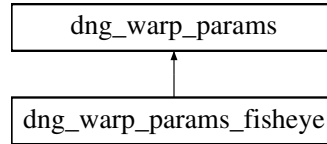

- [dng_lens_correction.h](#)
- [dng_lens_correction.cpp](#)

6.167 dng_warp_params_fisheye Class Reference

Warp parameters for fisheye camera model (radial component only). Note the restrictions described below.

```
#include <dng_lens_correction.h>
```

Public Attributes

- [dng_vector](#) **fRadParams** [[kMaxColorPlanes](#)]

6.167.1 Detailed Description

Warp parameters for fisheye camera model (radial component only). Note the restrictions described below.

6.167.2 Constructor & Destructor Documentation

- 6.167.2.1 [dng_warp_params_fisheye::dng_warp_params_fisheye](#) (uint32 *planes*, const [dng_vector](#) *radParams*[], const [dng_point_real64](#) & *fCenter*)

Create rectilinear warp parameters with the specified number of planes, radial component terms, and image center in relative coordinates.

6.167.3 Member Function Documentation

6.167.3.1 `real64 dng_warp_params_fisheye::Evaluate (uint32 plane, real64 r) const [virtual]`

Evaluate the 1D radial warp function for the specified plane. Parameter *r* is the destination (i.e., corrected) normalized radius, i.e., the normalized Euclidean distance between a corrected pixel position and the optical center in the image. *r* lies in the range [0,1]. The returned result is non-negative.

Implements [dng_warp_params](#).

Referenced by `EvaluateRatio()`, and `MaxSrcRadiusGap()`.

6.167.3.2 `real64 dng_warp_params_fisheye::EvaluateRatio (uint32 plane, real64 r2) const [virtual]`

Evaluate the 1D radial warp ratio function for the specified plane. Parameter *r2* is the square of the destination (i.e., corrected) normalized radius, i.e., the square of the normalized Euclidean distance between a corrected pixel position and the optical center in the image. *r2* must lie in the range [0,1]. Note that this is different than the `Evaluate ()` function, above, in that the argument to `EvaluateRatio ()` is the square of the radius, not the radius itself. The returned result is non-negative. Mathematically, `EvaluateRatio (r * r)` is the same as `Evaluate (r) / r`.

Implements [dng_warp_params](#).

References `Evaluate()`.

6.167.3.3 `dng_point_real64 dng_warp_params_fisheye::EvaluateTangential (uint32 plane, real64 r2, const dng_point_real64 & diff, const dng_point_real64 & diff2) const [virtual]`

Evaluate the 2D tangential warp for the specified plane. Parameter *r2* is the square of the destination (i.e., corrected) normalized radius, i.e., the square of the normalized Euclidean distance between a corrected pixel position *P* and the optical center in the image. *r2* must lie in the range [0,1]. *diff* contains the vertical and horizontal Euclidean distances (in pixels) between *P* and the optical center. *diff2* contains the squares of the vertical and horizontal Euclidean distances (in pixels) between *P* and the optical center. The returned result is the tangential warp offset, measured in pixels.

Implements [dng_warp_params](#).

References `ThrowProgramError()`.

6.167.3.4 `real64 dng_warp_params_fisheye::MaxSrcRadiusGap (real64 maxDstGap) const [virtual]`

Compute and return the maximum warped radius gap. Let *D* be a rectangle in a destination (corrected) image. Let *rDstFar* and *rDstNear* be the farthest and nearest points to the image center, respectively. Then the specified parameter *maxDstGap* is the Euclidean distance between *rDstFar* and *rDstNear*. Warp *D* through this warp function to a closed and bounded (generally not rectangular) region *S*. Let *rSrcfar* and *rSrcNear* be the farthest and nearest points to the image center, respectively. This routine returns a value that is at least (*rSrcFar* - *rSrcNear*).

Implements [dng_warp_params](#).

References `DNG_REQUIRE`, and `Evaluate()`.

6.167.3.5 `dng_point_real64 dng_warp_params_fisheye::MaxSrcTanGap (dng_point_real64 minDst, dng_point_real64 maxDst) const [virtual]`

Compute and return the maximum warped tangential gap. *minDst* is the top-left pixel of the image in normalized pixel coordinates. *maxDst* is the bottom-right pixel of the image in normalized pixel coordinates. `MaxSrcTanGap ()` computes the maximum absolute shift in normalized pixels in the horizontal and vertical directions that can occur as a result of the tangential warp.

Implements [dng_warp_params](#).

6.168.1 Detailed Description

Warp parameters for pinhole perspective rectilinear (not fisheye) camera model. Supports radial and tangential (decentering) distortion correction parameters.

Note the restrictions described below.

6.168.2 Constructor & Destructor Documentation

6.168.2.1 `dng_warp_params_rectilinear::dng_warp_params_rectilinear (uint32 planes, const dng_vector radParams[], const dng_vector tanParams[], const dng_point_real64 & fCenter)`

Create rectilinear warp parameters with the specified number of planes, radial component terms, tangential component terms, and image center in relative coordinates.

6.168.3 Member Function Documentation

6.168.3.1 `real64 dng_warp_params_rectilinear::Evaluate (uint32 plane, real64 r) const [virtual]`

Evaluate the 1D radial warp function for the specified plane. Parameter *r* is the destination (i.e., corrected) normalized radius, i.e., the normalized Euclidean distance between a corrected pixel position and the optical center in the image. *r* lies in the range [0,1]. The returned result is non-negative.

Implements [dng_warp_params](#).

Referenced by `MaxSrcRadiusGap()`.

6.168.3.2 `real64 dng_warp_params_rectilinear::EvaluateRatio (uint32 plane, real64 r2) const [virtual]`

Evaluate the 1D radial warp ratio function for the specified plane. Parameter *r2* is the square of the destination (i.e., corrected) normalized radius, i.e., the square of the normalized Euclidean distance between a corrected pixel position and the optical center in the image. *r2* must lie in the range [0,1]. Note that this is different than the `Evaluate ()` function, above, in that the argument to `EvaluateRatio ()` is the square of the radius, not the radius itself. The returned result is non-negative. Mathematically, `EvaluateRatio (r * r)` is the same as `Evaluate (r) / r`.

Implements [dng_warp_params](#).

6.168.3.3 `dng_point_real64 dng_warp_params_rectilinear::EvaluateTangential (uint32 plane, real64 r2, const dng_point_real64 & diff, const dng_point_real64 & diff2) const [virtual]`

Evaluate the 2D tangential warp for the specified plane. Parameter *r2* is the square of the destination (i.e., corrected) normalized radius, i.e., the square of the normalized Euclidean distance between a corrected pixel position *P* and the optical center in the image. *r2* must lie in the range [0,1]. *diff* contains the vertical and horizontal Euclidean distances (in pixels) between *P* and the optical center. *diff2* contains the squares of the vertical and horizontal Euclidean distances (in pixels) between *P* and the optical center. The returned result is the tangential warp offset, measured in pixels.

Implements [dng_warp_params](#).

6.168.3.4 `real64 dng_warp_params_rectilinear::MaxSrcRadiusGap (real64 maxDstGap) const [virtual]`

Compute and return the maximum warped radius gap. Let *D* be a rectangle in a destination (corrected) image. Let *rDstFar* and *rDstNear* be the farthest and nearest points to the image center, respectively. Then the specified parameter *maxDstGap* is the Euclidean distance between *rDstFar* and *rDstNear*. Warp *D* through this warp function to a closed and bounded (generally not rectangular) region *S*. Let *rSrcFar* and *rSrcNear* be the farthest and nearest points to the image center, respectively. This routine returns a value that is at least (*rSrcFar* - *rSrcNear*).

Implements [dng_warp_params](#).

References Evaluate().

6.168.3.5 `dng_point_real64 dng_warp_params_rectilinear::MaxSrcTanGap (dng_point_real64 minDst, dng_point_real64 maxDst) const` `[virtual]`

Compute and return the maximum warped tangential gap. minDst is the top-left pixel of the image in normalized pixel coordinates. maxDst is the bottom-right pixel of the image in normalized pixel coordinates. MaxSrcTanGap () computes the maximum absolute shift in normalized pixels in the horizontal and vertical directions that can occur as a result of the tangential warp.

Implements [dng_warp_params](#).

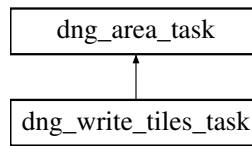

References `dng_warp_params::EvaluateTangential2()`.

6.169 dng_write_tiles_task Class Reference

Inheritance diagram for `dng_write_tiles_task`:

Public Member Functions

- **dng_write_tiles_task** ([dng_image_writer](#) &imageWriter, [dng_host](#) &host, const [dng_ifd](#) &ifd, [dng_basic_tag_set](#) &basic, [dng_stream](#) &stream, const [dng_image](#) &image, uint32 fakeChannels, uint32 tilesDown, uint32 tilesAcross, uint32 compressedSize, uint32 uncompressedSize)
- void **Process** (uint32, const [dng_rect](#) &, [dng_abort_sniffer](#) *sniffer)

Additional Inherited Members

6.169.1 Member Function Documentation

6.169.1.1 `void dng_write_tiles_task::Process (uint32 threadIndex, const dng_rect & tile, dng_abort_sniffer * sniffer)` `[inline], [virtual]`

Process one tile or fully partitioned area. This method is overridden by derived classes to implement the actual image processing. Note that the sniffer can be ignored if it is certain that a processing task will complete very quickly. This method should never be called directly but rather accessed via Process. There is no allocator parameter as all allocation should be done in Start.

Parameters

<i>threadIndex</i>	0 to threadCount - 1 index indicating which thread this is. (Can be used to get a thread-specific buffer allocated in the Start method.)
<i>tile</i>	Area to process.
<i>sniffer</i>	dng_abort_sniffer to use to check for user cancellation and progress updates.

Implements [dng_area_task](#).

References [dng_host::Allocate\(\)](#), [dng_host::Allocator\(\)](#), [dng_stream::LittleEndian\(\)](#), [dng_stream::Position\(\)](#), [dng_stream::Put_uint8\(\)](#), [AutoPtr< T >::Reset\(\)](#), [dng_stream::SetLittleEndian\(\)](#), and [dng_abort_sniffer::SniffForAbort\(\)](#).

6.176 dng_hue_sat_map::HSBModify Struct Reference

```
#include <dng_hue_sat_map.h>
```

Public Attributes

- real32 **fHueShift**
- real32 **fSatScale**
- real32 **fValScale**

6.176.1 Detailed Description

HSV delta signal.

Parameters

<i>fHueShift</i>	is a delta value specified in degrees. This parameter, added to the original hue, determines the output hue. A value of 0 means no change.
<i>fSatScale</i>	and
<i>fValScale</i>	are scale factors that are applied to saturation and value components, respectively. These scale factors, multiplied by the original saturation and value, determine the output saturation and value. A scale factor of 1.0 means no change.

The documentation for this struct was generated from the following file:

- [dng_hue_sat_map.h](#)

6.177 HuffmanTable Struct Reference

Public Attributes

- uint8 **bits** [17]

Protected Member Functions

- **tiff_tag** (uint16 code, uint16 type, uint32 count)

Protected Attributes

- uint16 **fCode**
- uint16 **fType**
- uint32 **fCount**

The documentation for this class was generated from the following file:

- [dng_image_writer.h](#)

6.211 UnicodeToLowASCIIEEntry Struct Reference

Public Attributes

- uint32 **unicode**
- const char * **ascii**

The documentation for this struct was generated from the following file:

- dng_string.cpp

7 File Documentation

7.1 dng_1d_function.h File Reference

Classes

- class [dng_1d_function](#)
A 1D floating-point function.
- class [dng_1d_identity](#)
An identity ($x \rightarrow y$ such that $x == y$ for all x) mapping function.
- class [dng_1d_concatenate](#)
A [dng_1d_function](#) that represents the composition (curry) of two other [dng_1d_functions](#).
- class [dng_1d_inverse](#)
A [dng_1d_function](#) that represents the inverse of another [dng_1d_function](#).

7.1.1 Detailed Description

Classes for a 1D floating-point to floating-point function abstraction.

7.2 dng_1d_table.h File Reference

Classes

- class [dng_1d_table](#)
A 1D floating-point lookup table using linear interpolation.

7.2.1 Detailed Description

Definition of a lookup table based 1D floating-point to floating-point function abstraction using linear interpolation.

7.3 dng_abort_sniffer.h File Reference

Classes

- class [dng_set_minimum_priority](#)
Convenience class for setting thread priority level to minimum.

- class [dng_abort_sniffer](#)
Class for signaling user cancellation and receiving progress updates.
- class [dng_sniffer_task](#)
Class to establish scope of a named subtask in DNG processing.

Enumerations

- enum [dng_priority](#) {
 dng_priority_low, **dng_priority_medium**, **dng_priority_high**, **dng_priority_count**,
 dng_priority_minimum = dng_priority_low, **dng_priority_maximum** = dng_priority_high }
Thread priority level.

7.3.1 Detailed Description

Classes supporting user cancellation and progress tracking.

7.4 dng_area_task.h File Reference

Classes

- class [dng_area_task](#)
Abstract class for rectangular processing operations with support for partitioning across multiple processing resources and observing memory constraints.

7.4.1 Detailed Description

Class to handle partitioning a rectangular image processing operation taking into account multiple processing resources and memory constraints.

7.5 dng_assertions.h File Reference

Macros

- `#define DNG_ASSERT(x, y)`
- `#define DNG_REQUIRE(condition, msg)`
- `#define DNG_REPORT(x) DNG_ASSERT (false, x)`

7.5.1 Detailed Description

Conditionally compiled assertion check support.

7.5.2 Macro Definition Documentation

7.5.2.1 `#define DNG_ASSERT(x, y)`

Conditionally compiled macro to check an assertion and display a message if it fails and assertions are compiled in via `qDNGDebug`

Parameters

<i>x</i>	Predicate which must be true.
<i>y</i>	String to display if <i>x</i> is not true.

Referenced by `dng_negative::AnalogBalance()`, `dng_color_spec::CameraToPCS()`, `dng_color_spec::CameraWhite()`, `dng_pixel_buffer::DirtyPixel()`, `dng_camera_profile_id::dng_camera_profile_id()`, `dng_warp_params::dng_warp_params()`, `dng_spline_solver::Evaluate()`, `dng_gamma_encode_proxy::Evaluate()`, `dng_1d_table::Interpolate()`, `dng_warp_params_rectilinear::IsRadNOP()`, `dng_warp_params_rectilinear::IsTanNOP()`, `dng_color_spec::PCStoCamera()`, `dng_opcode_FixVignetteRadial::Prepare()`, `dng_md5_printer::Process()`, `dng_find_new_raw_image_digest_task::Process()`, `dng_pixel_buffer::SetConstant_int16()`, `dng_pixel_buffer::SetConstant_real32()`, `dng_pixel_buffer::SetConstant_uint16()`, `dng_pixel_buffer::SetConstant_uint32()`, `dng_pixel_buffer::SetConstant_uint8()`, `dng_hue_sat_map::SetDivisions()`, `dng_iptc::Spool()`, `dng_color_spec::WhiteXY()`, and `dng_image_writer::WriteDNG()`.

7.5.2.2 `#define DNG_REPORT(x) DNG_ASSERT (false, x)`

Macro to display an informational message

Parameters

<i>x</i>	String to display.
----------	--------------------

Referenced by `dng_hue_sat_map::GetDelta()`, `dng_hue_sat_map::Interpolate()`, `dng_find_new_raw_image_digest_task::Process()`, and `dng_hue_sat_map::SetDeltaKnownWriteable()`.

7.5.2.3 `#define DNG_REQUIRE(condition, msg)`

Value:

```
do
{
    if (!(condition))
    {
        ThrowProgramError (msg);
    }
}
while (0)
```

Conditionally compiled macro to check an assertion, display a message, and throw an exception if it fails and assertions are compiled in via `qDNGDebug`

Parameters

<i>condition</i>	Predicate which must be true.
<i>msg</i>	String to display if condition is not true.

Referenced by `dng_vignette_radial_function::Evaluate()`, `dng_warp_params_fisheye::MaxSrcRadiusGap()`, `dng_noise_profile::NoiseFunction()`, `dng_opcode_FixVignetteRadial::PutData()`, and `dng_filter_warp::SrcTileSize()`.

7.6 dng_auto_ptr.h File Reference

Classes

- class [AutoPtr< T >](#)

A class intended to be used in stack scope to hold a pointer from new. The held pointer will be deleted automatically if the scope is left without calling Release on the [AutoPtr](#) first.

- class [AutoArray< T >](#)

A class intended to be used similarly to [AutoPtr](#) but for arrays.

7.6.1 Detailed Description

Class to implement std::auto_ptr like functionality even on platforms which do not have a full Standard C++ library.

7.7 dng_bad_pixels.h File Reference

Classes

- class [dng_opcode_FixBadPixelsConstant](#)
An opcode to fix individual bad pixels that are marked with a constant value (e.g., 0) in a Bayer image.
- class [dng_bad_pixel_list](#)
A list of bad pixels and rectangles (usually single rows or columns).
- class [dng_opcode_FixBadPixelsList](#)
An opcode to fix lists of bad pixels (indicated by position) in a Bayer image.

7.7.1 Detailed Description

Opcodes to fix defective pixels, including individual pixels and regions (such as defective rows and columns).

7.8 dng_bottlenecks.h File Reference

- void **DoResampleAcross16** (const uint16 *sPtr, uint16 *dPtr, uint32 dCount, const int32 *coord, const int16 *wPtr, uint32 wCount, uint32 wStep, uint32 pixelRange)
- void **DoResampleAcross32** (const real32 *sPtr, real32 *dPtr, uint32 dCount, const int32 *coord, const real32 *wPtr, uint32 wCount, uint32 wStep)

- bool **DoEqualBytes** (const void *sPtr, const void *dPtr, uint32 count)
- bool **DoEqualArea8** (const uint8 *sPtr, const uint8 *dPtr, uint32 rows, uint32 cols, uint32 planes, int32 sRowStep, int32 sColStep, int32 sPlaneStep, int32 dRowStep, int32 dColStep, int32 dPlaneStep)
- bool **DoEqualArea16** (const uint16 *sPtr, const uint16 *dPtr, uint32 rows, uint32 cols, uint32 planes, int32 sRowStep, int32 sColStep, int32 sPlaneStep, int32 dRowStep, int32 dColStep, int32 dPlaneStep)
- bool **DoEqualArea32** (const uint32 *sPtr, const uint32 *dPtr, uint32 rows, uint32 cols, uint32 planes, int32 sRowStep, int32 sColStep, int32 sPlaneStep, int32 dRowStep, int32 dColStep, int32 dPlaneStep)
- void **DoVignetteMask16** (uint16 *mPtr, uint32 rows, uint32 cols, int32 rowStep, int64 offsetH, int64 offsetV, int64 stepH, int64 stepV, uint32 tBits, const uint16 *table)
- void **DoVignette16** (int16 *sPtr, const uint16 *mPtr, uint32 rows, uint32 cols, uint32 planes, int32 sRowStep, int32 sPlaneStep, int32 mRowStep, uint32 mBits)
- void **DoVignette32** (real32 *sPtr, const uint16 *mPtr, uint32 rows, uint32 cols, uint32 planes, int32 sRowStep, int32 sPlaneStep, int32 mRowStep, uint32 mBits)
- void **DoMapArea16** (uint16 *dPtr, uint32 count0, uint32 count1, uint32 count2, int32 step0, int32 step1, int32 step2, const uint16 *map)

Variables

- [dng_suite](#) **gDNGSuite**

7.8.1 Detailed Description

Indirection mechanism for performance-critical routines that might be replaced with hand-optimized or hardware-specific implementations.

7.9 dng_camera_profile.h File Reference

Classes

- class [dng_camera_profile_id](#)
An ID for a camera profile consisting of a name and optional fingerprint.
- class [dng_camera_profile](#)
Container for DNG camera color profile and calibration data.

Functions

- void **SplitCameraProfileName** (const [dng_string](#) &name, [dng_string](#) &baseName, int32 &version)
- void **BuildHueSatMapEncodingTable** ([dng_memory_allocator](#) &allocator, uint32 encoding, [AutoPtr](#)< [dng_1d_table](#) > &encodeTable, [AutoPtr](#)< [dng_1d_table](#) > &decodeTable, bool subSample)

Variables

- const char * **kProfileName_Embedded**
- const char * **kAdobeCalibrationSignature**

7.9.1 Detailed Description

Support for DNG camera color profile information. Per the [DNG 1.1.0 specification](#), a DNG file can store up to two sets of color profile information for a camera in the DNG file from that camera. The second set is optional and when there are two sets, they represent profiles made under different illumination.

Profiling information is optionally separated into two parts. One part represents a profile for a reference camera. (ColorMatrix1 and ColorMatrix2 here.) The second is a per-camera calibration that takes into account unit-to-unit variation. This is designed to allow replacing the reference color matrix with one of one's own construction while maintaining any unit-specific calibration the camera manufacturer may have provided.

See Appendix 6 of the [DNG 1.1.0 specification](#) for more information.

7.10 dng_color_space.h File Reference

Classes

- class [dng_function_GammaEncode_sRGB](#)
A [dng_1d_function](#) for gamma encoding in sRGB color space.
- class [dng_function_GammaEncode_1_8](#)
A [dng_1d_function](#) for gamma encoding with 1.8 gamma.
- class [dng_function_GammaEncode_2_2](#)
A [dng_1d_function](#) for gamma encoding with 2.2 gamma.
- class [dng_color_space](#)
An abstract color space.
- class [dng_space_sRGB](#)
Singleton class for sRGB color space.
- class [dng_space_AdobeRGB](#)
Singleton class for AdobeRGB color space.
- class [dng_space_ColorMatch](#)
Singleton class for ColorMatch color space.
- class [dng_space_ProPhoto](#)
Singleton class for ProPhoto RGB color space.
- class [dng_space_GrayGamma18](#)
Singleton class for gamma 1.8 grayscale color space.
- class [dng_space_GrayGamma22](#)
Singleton class for gamma 2.2 grayscale color space.
- class [dng_space_fakeRGB](#)

7.10.1 Detailed Description

Standard gamma functions and color spaces used within the DNG SDK.

7.11 dng_color_spec.h File Reference

Classes

- class [dng_color_spec](#)

Functions

- [dng_matrix_3by3 MapWhiteMatrix](#) (const [dng_xy_coord](#) &white1, const [dng_xy_coord](#) &white2)
Compute a 3x3 matrix which maps colors from white point white1 to white point white2.

7.11.1 Detailed Description

Class for holding a specific color transform.

7.11.2 Function Documentation

7.11.2.1 [dng_matrix_3by3 MapWhiteMatrix](#) (const [dng_xy_coord](#) & white1, const [dng_xy_coord](#) & white2)

Compute a 3x3 matrix which maps colors from white point white1 to white point white2.

Uses linearized Bradford adaptation matrix to compute a mapping from colors measured with one white point (white1) to another (white2).

7.12 dng_date_time.h File Reference

Classes

- class [dng_date_time](#)
Class for holding a date/time and converting to and from relevant date/time formats.
- class [dng_time_zone](#)
Class for holding a time zone.
- class [dng_date_time_info](#)
Class for holding complete data/time/zone information.
- class [dng_date_time_storage_info](#)
Store file offset from which date was read.

Enumerations

- enum [dng_date_time_format](#) { [dng_date_time_format_unknown](#) = 0, [dng_date_time_format_exif](#) = 1, [dng_date_time_format_unix_little_endian](#) = 2, [dng_date_time_format_unix_big_endian](#) = 3 }
Tag to encode date representation format.

Functions

- void [CurrentDateTimeAndZone](#) ([dng_date_time_info](#) &info)
- void [DecodeUnixTime](#) (uint32 unixTime, [dng_date_time](#) &dt)
Convert UNIX "seconds since Jan 1, 1970" time to a [dng_date_time](#).
- [dng_time_zone LocalTimeZone](#) (const [dng_date_time](#) &dt)

Variables

- bool [gDNGUseFakeTimeZonesInXMP](#)

7.12.1 Detailed Description

Functions and classes for working with dates and times in DNG files.

7.12.2 Enumeration Type Documentation

7.12.2.1 enum dng_date_time_format

Tag to encode date representation format.

Enumerator:

- dng_date_time_format_exif** Date format not known.
- dng_date_time_format_unix_little_endian** EXIF date string.
- dng_date_time_format_unix_big_endian** 32-bit UNIX time as 4-byte little endian

7.12.3 Function Documentation

7.12.3.1 void CurrentDateTimeAndZone (dng_date_time_info & info)

Get the current date/time and timezone.

Parameters

<i>info</i>	Receives current data/time/zone.
-------------	----------------------------------

7.12.3.2 dng_time_zone LocalTimeZone (const dng_date_time & dt)

Return timezone of current location at a given date.

Parameters

<i>dt</i>	Date at which to compute timezone difference. (For example, used to determine Daylight Savings, etc.)
-----------	---

Return values

<i>Time</i>	zone for date/time dt.
-------------	------------------------

References `dng_date_time::IsValid()`.

7.13 dng_errors.h File Reference

Typedefs

- typedef int32 [dng_error_code](#)
Type for all errors used in DNG SDK. Generally held inside a [dng_exception](#).

Enumerations

- enum {
[dng_error_none](#) = 0, [dng_error_unknown](#) = 100000, [dng_error_not_yet_implemented](#), [dng_error_silent](#),
[dng_error_user_canceled](#), [dng_error_host_insufficient](#), [dng_error_memory](#), [dng_error_bad_format](#),
[dng_error_matrix_math](#), [dng_error_open_file](#), [dng_error_read_file](#), [dng_error_write_file](#),
[dng_error_end_of_file](#), [dng_error_file_is_damaged](#), [dng_error_image_too_big_dng](#), [dng_error_image_too_big_tiff](#),
[dng_error_unsupported_dng](#) }

7.13.1 Detailed Description

Error code values.

7.13.2 Enumeration Type Documentation

7.13.2.1 anonymous enum

Enumerator:

- [dng_error_none](#)** No error. Success.
- [dng_error_unknown](#)** Logic or program error or other unclassifiable error.
- [dng_error_not_yet_implemented](#)** Functionality requested is not yet implemented.
- [dng_error_silent](#)** An error which should not be signalled to user.
- [dng_error_user_canceled](#)** Processing stopped by user (or host application) request.
- [dng_error_host_insufficient](#)** Necessary host functionality is not present.
- [dng_error_memory](#)** Out of memory.
- [dng_error_bad_format](#)** File format is not valid.
- [dng_error_matrix_math](#)** Matrix has wrong shape, is badly conditioned, or similar problem.
- [dng_error_open_file](#)** Could not open file.
- [dng_error_read_file](#)** Error reading file.
- [dng_error_write_file](#)** Error writing file.
- [dng_error_end_of_file](#)** Unexpected end of file.
- [dng_error_file_is_damaged](#)** File is damaged in some way.
- [dng_error_image_too_big_dng](#)** Image is too big to save as DNG.
- [dng_error_image_too_big_tiff](#)** Image is too big to save as TIFF.
- [dng_error_unsupported_dng](#)** DNG version is unsupported.

7.14 dng_exceptions.h File Reference

Classes

- class [dng_exception](#)
All exceptions thrown by the DNG SDK use this exception class.

Functions

- void [ReportWarning](#) (const char *message, const char *sub_message=NULL)
Display a warning message. Note that this may just eat the message.
- void [ReportError](#) (const char *message, const char *sub_message=NULL)
Display an error message. Note that this may just eat the message.
- void [Throw_dng_error](#) (dng_error_code err, const char *message=NULL, const char *sub_message=NULL, bool silent=false)
Throw an exception based on an arbitrary error code.
- void [Fail_dng_error](#) (dng_error_code err)
Convenience function to throw [dng_exception](#) with error code if error_code is not dng_error_none .
- void [ThrowProgramError](#) (const char *sub_message=NULL)
Convenience function to throw [dng_exception](#) with error code dng_error_unknown .
- void [ThrowNotYetImplemented](#) (const char *sub_message=NULL)
Convenience function to throw [dng_exception](#) with error code dng_error_not_yet_implemented .
- void [ThrowSilentError](#) ()
Convenience function to throw [dng_exception](#) with error code dng_error_silent .
- void [ThrowUserCanceled](#) ()
Convenience function to throw [dng_exception](#) with error code dng_error_user_canceled .
- void [ThrowHostInsufficient](#) (const char *sub_message=NULL)
Convenience function to throw [dng_exception](#) with error code dng_error_host_insufficient .
- void [ThrowMemoryFull](#) (const char *sub_message=NULL)
Convenience function to throw [dng_exception](#) with error code dng_error_memory .
- void [ThrowBadFormat](#) (const char *sub_message=NULL)
Convenience function to throw [dng_exception](#) with error code dng_error_bad_format .
- void [ThrowMatrixMath](#) (const char *sub_message=NULL)
Convenience function to throw [dng_exception](#) with error code dng_error_matrix_math .
- void [ThrowOpenFile](#) (const char *sub_message=NULL, bool silent=false)
Convenience function to throw [dng_exception](#) with error code dng_error_open_file .
- void [ThrowReadFile](#) (const char *sub_message=NULL)
Convenience function to throw [dng_exception](#) with error code dng_error_read_file .
- void [ThrowWriteFile](#) (const char *sub_message=NULL)
Convenience function to throw [dng_exception](#) with error code dng_error_write_file .
- void [ThrowEndOfFile](#) (const char *sub_message=NULL)
Convenience function to throw [dng_exception](#) with error code dng_error_end_of_file .
- void [ThrowFileIsDamaged](#) ()
Convenience function to throw [dng_exception](#) with error code dng_error_file_is_damaged .
- void [ThrowImageTooBigDNG](#) ()
Convenience function to throw [dng_exception](#) with error code dng_error_image_too_big_dng .
- void [ThrowImageTooBigTIFF](#) ()
Convenience function to throw [dng_exception](#) with error code dng_error_image_too_big_tiff .
- void [ThrowUnsupportedDNG](#) ()
Convenience function to throw [dng_exception](#) with error code dng_error_unsupported_dng .

7.14.1 Detailed Description

C++ exception support for DNG SDK.

7.15 dng_exif.h File Reference

Classes

- class [dng_exif](#)
Container class for parsing and holding EXIF tags.

7.15.1 Detailed Description

EXIF read access support. See the [EXIF specification](#) for full description of tags.

7.16 dng_fast_module.h File Reference

7.16.1 Detailed Description

Include file to set optimization to highest level for performance-critical routines. Normal files should have optimization set to normal level to save code size as there is less cache pollution this way.

7.17 dng_file_stream.h File Reference

Classes

- class [dng_file_stream](#)
A stream to/from a disk file. See [dng_stream](#) for read/write interface.

7.17.1 Detailed Description

Simple, portable, file read/write support.

7.18 dng_filter_task.h File Reference

Classes

- class [dng_filter_task](#)
Represents a task which filters an area of a source [dng_image](#) to an area of a destination [dng_image](#).

7.18.1 Detailed Description

Specialization of [dng_area_task](#) for processing an area from one [dng_image](#) to an area of another.

7.19 dng_fingerprint.h File Reference

Classes

- class [dng_fingerprint](#)
Container fingerprint (MD5 only at present).
- struct [dng_fingerprint_less_than](#)

Utility to compare fingerprints (e.g., for sorting).

- class [dng_md5_printer](#)

Class to hash binary data to a fingerprint using the MD5 Message-Digest Algorithm.

- class [dng_md5_printer_stream](#)

A [dng_stream](#) based interface to the MD5 printing logic.

7.19.1 Detailed Description

Fingerprint (cryptographic hashing) support for generating strong hashes of image data.

7.20 dng_flags.h File Reference

Macros

- `#define qImagecore 0`
- `#define qiPhone 0`
- `#define qiPhoneSimulator 0`
- `#define qAndroid 0`
- `#define qAndroidArm7 0`
- `#define qDNGDebug 0`
- `#define qDNGLittleEndian !qDNGBigEndian`
- `#define qDNG64Bit 0`
- `#define qDNGThreadSafe (qMacOS || qWinOS)`
- `#define qDNGValidateTarget 0`
- `#define qDNGValidate qDNGValidateTarget`
- `#define qDNGPrintMessages qDNGValidate`
- `#define qDNGCodec 0`
- `#define qDNGExperimental 1`
- `#define qDNGXMPFiles 1`
- `#define qDNGXMPDocOps (!qDNGValidateTarget)`
- `#define qDNGUseLibJPEG qDNGValidateTarget`

7.20.1 Detailed Description

Conditional compilation flags for DNG SDK.

All conditional compilation macros for the DNG SDK begin with a lowercase 'q'.

7.20.2 Macro Definition Documentation

7.20.2.1 `#define qDNG64Bit 0`

1 if this target platform uses 64-bit addresses, 0 otherwise.

7.20.2.2 `#define qDNGCodec 0`

1 to build the Windows Imaging Component Codec (e.g. for Vista).

7.20.2.3 #define qDNGDebug 0

1 if debug code is compiled in, 0 otherwise. Enables assertions and other debug checks in exchange for slower processing.

7.20.2.4 #define qDNGLittleEndian !qDNGBigEndian

1 if this target platform is little endian (e.g. x86 processors), else 0.

7.20.2.5 #define qDNGPrintMessages qDNGValidate

1 if dng_show_message should use fprintf to stderr. 0 if it should use a platform specific interrupt mechanism.

7.20.2.6 #define qDNGThreadSafe (qMacOS || qWinOS)

1 if target platform has thread support and threadsafe libraries, 0 otherwise.

7.20.2.7 #define qDNGUseLibJPEG qDNGValidateTarget

1 to use open-source libjpeg for lossy jpeg processing.

7.20.2.8 #define qDNGValidate qDNGValidateTarget

1 if DNG validation code is enabled, 0 otherwise.

7.20.2.9 #define qDNGValidateTarget 0

1 if dng_validate command line tool is being built, 0 otherwise.

7.20.2.10 #define qDNGXMPDocOps (!qDNGValidateTarget)

1 to use XMPDocOps.

7.20.2.11 #define qDNGXMPFiles 1

1 to use XMPFiles.

7.21 dng_gain_map.h File Reference

Classes

- class [dng_gain_map](#)
Holds a discrete (i.e., sampled) 2D representation of a gain map. This is effectively an image containing scale factors.
- class [dng_opcode_GainMap](#)
An opcode to fix 2D spatially-varying light falloff or color casts (i.e., uniformity issues). This is commonly due to shading.

7.21.1 Detailed Description

Opcode to fix 2D uniformity defects, such as shading.

7.22 dng_globals.h File Reference

7.22.1 Detailed Description

Definitions of global variables controlling DNG SDK behavior. Currently only used for validation control.

7.23 dng_host.h File Reference

Classes

- class [dng_host](#)

The main class for communication between the application and the DNG SDK. Used to customize memory allocation and other behaviors.

7.23.1 Detailed Description

Class definition for [dng_host](#), initial point of contact and control between host application and DNG SDK.

7.24 dng_hue_sat_map.h File Reference

Classes

- class [dng_hue_sat_map](#)

A 3D table that maps HSV (hue, saturation, and value) floating-point input coordinates in the range [0,1] to delta signals. The table must have at least 1 sample in the hue dimension, at least 2 samples in the saturation dimension, and at least 1 sample in the value dimension. Tables are stored in value-hue-saturation order.

- struct [dng_hue_sat_map::HSBModify](#)

7.24.1 Detailed Description

Table-based color correction data structure.

7.25 dng_ifd.h File Reference

Classes

- class [dng_preview_info](#)
- class [dng_ifd](#)

Container for a single image file directory of a digital negative.

7.25.1 Detailed Description

DNG image file directory support.

7.26 dng_image.h File Reference

Classes

- class [dng_tile_buffer](#)

Class to get resource acquisition is instantiation behavior for tile buffers. Can be dirty or constant tile access.

- class [dng_const_tile_buffer](#)

Class to get resource acquisition is instantiation behavior for constant (read-only) tile buffers.

- class [dng_dirty_tile_buffer](#)

Class to get resource acquisition is instantiation behavior for dirty (writable) tile buffers.

- class [dng_image](#)

Base class for holding image data in DNG SDK. See [dng_simple_image](#) for derived class most often used in DNG SDK.

7.26.1 Detailed Description

Support for working with image data in DNG SDK.

7.27 dng_image_writer.h File Reference

Classes

- class [dng_resolution](#)

Image resolution.

- class [tiff_tag](#)
- class [tag_data_ptr](#)
- class [tag_string](#)
- class [tag_encoded_text](#)
- class [tag_uint8](#)
- class [tag_uint8_ptr](#)
- class [tag_uint16](#)
- class [tag_int16_ptr](#)
- class [tag_uint16_ptr](#)
- class [tag_uint32](#)
- class [tag_uint32_ptr](#)
- class [tag_urational](#)
- class [tag_urational_ptr](#)
- class [tag_srational](#)
- class [tag_srational_ptr](#)
- class [tag_real64](#)
- class [tag_matrix](#)
- class [tag_icc_profile](#)
- class [tag_cfa_pattern](#)
- class [tag_exif_date_time](#)
- class [tag_iptc](#)
- class [tag_xmp](#)
- class [dng_tiff_directory](#)
- class [dng_basic_tag_set](#)
- class [exif_tag_set](#)
- class [tiff_dng_extended_color_profile](#)
- class [tag_dng_noise_profile](#)
- class [dng_image_writer](#)

Support for writing [dng_image](#) or [dng_negative](#) instances to a [dng_stream](#) in TIFF or DNG format.

Enumerations

- enum **dng_metadata_subset** {
 kMetadataSubset_CopyrightOnly = 0, **kMetadataSubset_CopyrightAndContact**, **kMetadataSubset_All-ExceptCameraInfo**, **kMetadataSubset_All**,
 kMetadataSubset_AllExceptLocationInfo, **kMetadataSubset_AllExceptCameraAndLocation**, **kMetadataSubset_Last** = **kMetadataSubset_AllExceptCameraAndLocation** }

7.27.1 Detailed Description

Support for writing DNG images to files.

7.28 dng_info.h File Reference

Classes

- class **dng_info**
Top-level structure of DNG file with access to metadata.

7.28.1 Detailed Description

Class for holding top-level information about a DNG image.

7.29 dng_iptc.h File Reference

Classes

- class **dng_iptc**
Class for reading and holding IPTC metadata associated with a DNG file.

7.29.1 Detailed Description

Support for IPTC metadata within DNG files.

7.30 dng_lens_correction.h File Reference

Classes

- class **dng_warp_params**
Abstract base class holding common warp opcode parameters (e.g., number of planes, optical center) and common warp routines.
- class **dng_warp_params_rectilinear**
Warp parameters for pinhole perspective rectilinear (not fisheye) camera model. Supports radial and tangential (decentering) distortion correction parameters.
- class **dng_warp_params_fisheye**
Warp parameters for fisheye camera model (radial component only). Note the restrictions described below.
- class **dng_opcode_WarpRectilinear**
Warp opcode for pinhole perspective (rectilinear) camera model.

- class [dng_opcode_WarpFisheye](#)
Warp opcode for fisheye camera model.
- class [dng_vignette_radial_params](#)
Radially-symmetric vignette (peripheral illuminational falloff) correction parameters.
- class [dng_opcode_FixVignetteRadial](#)
Radially-symmetric lens vignette correction opcode.

7.30.1 Detailed Description

Opcodes to fix lens aberrations such as geometric distortion, lateral chromatic aberration, and vignetting (peripheral illumination falloff).

7.31 dng_linearization_info.h File Reference

Classes

- class [dng_linearization_info](#)
Class for managing data values related to DNG linearization.

7.31.1 Detailed Description

Support for linearization table and black level tags.

7.32 dng_lossless_jpeg.h File Reference

Classes

- class [dng_spooler](#)

Functions

- void **DecodeLosslessJPEG** ([dng_stream](#) &stream, [dng_spooler](#) &spooler, uint32 minDecodedSize, uint32 maxDecodedSize, bool bug16)
- void **EncodeLosslessJPEG** (const uint16 *srcData, uint32 srcRows, uint32 srcCols, uint32 srcChannels, uint32 srcBitDepth, int32 srcRowStep, int32 srcColStep, [dng_stream](#) &stream)

7.32.1 Detailed Description

Functions for encoding and decoding lossless JPEG format.

7.33 dng_matrix.h File Reference

Classes

- class [dng_matrix](#)
Class to represent 2D matrix up to kMaxColorPlanes x kMaxColorPlanes in size.
- class [dng_matrix_3by3](#)

- *A 3x3 matrix.*
- class [dng_matrix_4by3](#)
A 4x3 matrix. Handy for working with 4-color cameras.
- class [dng_vector](#)
Class to represent 1-dimensional vector with up to kMaxColorPlanes components.
- class [dng_vector_3](#)
A 3-element vector.
- class [dng_vector_4](#)
A 4-element vector.

Functions

- [dng_matrix](#) **operator*** (const [dng_matrix](#) &A, const [dng_matrix](#) &B)
- [dng_vector](#) **operator*** (const [dng_matrix](#) &A, const [dng_vector](#) &B)
- [dng_matrix](#) **operator*** (real64 scale, const [dng_matrix](#) &A)
- [dng_vector](#) **operator*** (real64 scale, const [dng_vector](#) &A)
- [dng_matrix](#) **operator+** (const [dng_matrix](#) &A, const [dng_matrix](#) &B)

7.33.1 Detailed Description

Matrix and vector classes, including specialized 3x3 and 4x3 versions as well as length 3 vectors.

7.34 dng_memory_stream.h File Reference

Classes

- class [dng_memory_stream](#)
A [dng_stream](#) which can be read from or written to memory.

7.34.1 Detailed Description

Stream abstraction to/from in-memory data.

7.35 dng_misc_opcodes.h File Reference

Classes

- class [dng_opcode_TrimBounds](#)
Opcode to trim image to a specified rectangle.
- class [dng_area_spec](#)

A class to describe an area of an image, including a pixel subrectangle, plane range, and row/column pitch (e.g., for mosaic images). Useful for specifying opcodes that only apply to specific color planes or pixel types (e.g., only one of the two green Bayer pixels).

- class [dng_opcode_MapTable](#)

An opcode to apply a 1D function (represented as a 16-bit table) to an image area.

- class [dng_opcode_MapPolynomial](#)

An opcode to apply a 1D function (represented as a polynomial) to an image area.

- class [dng_opcode_DeltaPerRow](#)

An opcode to apply a delta (i.e., offset) that varies per row. Within a row, the same delta value is applied to all specified pixels.

- class [dng_opcode_DeltaPerColumn](#)

An opcode to apply a delta (i.e., offset) that varies per column. Within a column, the same delta value is applied to all specified pixels.

- class [dng_opcode_ScalePerRow](#)

An opcode to apply a scale factor that varies per row. Within a row, the same scale factor is applied to all specified pixels.

- class [dng_opcode_ScalePerColumn](#)

An opcode to apply a scale factor that varies per column. Within a column, the same scale factor is applied to all specified pixels.

7.35.1 Detailed Description

Miscellaneous DNG opcodes.

7.36 dng_mosaic_info.h File Reference

Classes

- class [dng_mosaic_info](#)

Support for describing color filter array patterns and manipulating mosaic sample data.

7.36.1 Detailed Description

Support for descriptive information about color filter array patterns.

7.37 dng_negative.h File Reference

Classes

- class [dng_noise_function](#)

Noise model for photon and sensor read noise, assuming that they are independent random variables and spatially invariant.

- class [dng_noise_profile](#)

Noise profile for a negative.

- class [dng_metadata](#)

Main class for holding metadata.

- class [dng_negative](#)

Main class for holding DNG image data and associated metadata.

Macros

- #define **qMetadataOnConst** 0
- #define **METACONST**

7.37.1 Detailed Description

Functions and classes for working with a digital negative (image data and corresponding metadata).

7.38 dng_opcode_list.h File Reference

Classes

- class [dng_opcode_list](#)
A list of opcodes.

7.38.1 Detailed Description

List of opcodes.

7.39 dng_opcodes.h File Reference

Classes

- class [dng_opcode](#)
Virtual base class for opcode.
- class [dng_opcode_Unknown](#)
Class to represent unknown opcodes (e.g. opcodes defined in future DNG versions).
- class [dng_filter_opcode](#)
Class to represent a filter opcode, such as a convolution.
- class [dng_inplace_opcode](#)
Class to represent an in-place (i.e., pointwise, per-pixel) opcode, such as a global tone curve.

Enumerations

- enum [dng_opcode_id](#) {
dngOpcode_Private = 0, **dngOpcode_WarpRectilinear** = 1, **dngOpcode_WarpFisheye** = 2, **dngOpcode_Fix-VignetteRadial** = 3,
dngOpcode_FixBadPixelsConstant = 4, **dngOpcode_FixBadPixelsList** = 5, **dngOpcode_TrimBounds** = 6,
dngOpcode_MapTable = 7,
dngOpcode_MapPolynomial = 8, **dngOpcode_GainMap** = 9, **dngOpcode_DeltaPerRow** = 10, **dngOpcode_DeltaPerColumn** = 11,
dngOpcode_ScalePerRow = 12, **dngOpcode_ScalePerColumn** = 13 }
List of supported opcodes (by ID).

7.39.1 Detailed Description

Base class and common data structures for opcodes (introduced in DNG 1.3).

7.40 dng_pixel_buffer.h File Reference

Classes

- class [dng_pixel_buffer](#)
Holds a buffer of pixel data with "pixel geometry" metadata.

Macros

- #define **qDebugPixelType** 0
- #define **ASSERT_PIXEL_TYPE**(typeVal) [DNG_ASSERT](#) (fPixelFormat == typeVal, "Pixel type access mismatch")

Functions

- void [OptimizeOrder](#) (const void *sPtr, void *dPtr, uint32 sPixelSize, uint32 dPixelSize, uint32 &count0, uint32 &count1, uint32 &count2, int32 &sStep0, int32 &sStep1, int32 &sStep2, int32 &dStep0, int32 &dStep1, int32 &dStep2)
Compute best set of step values for a given source and destination area and stride.
- void **OptimizeOrder** (const void *sPtr, uint32 sPixelSize, uint32 &count0, uint32 &count1, uint32 &count2, int32 &sStep0, int32 &sStep1, int32 &sStep2)
- void **OptimizeOrder** (void *dPtr, uint32 dPixelSize, uint32 &count0, uint32 &count1, uint32 &count2, int32 &dStep0, int32 &dStep1, int32 &dStep2)

7.40.1 Detailed Description

Support for holding buffers of sample data.

7.41 dng_rational.h File Reference

Classes

- class [dng_srational](#)
- class [dng_urational](#)

7.41.1 Detailed Description

Signed and unsigned rational data types.

7.42 dng_read_image.h File Reference

Classes

- class [dng_row_interleaved_image](#)
- class [dng_read_image](#)

Functions

- bool **DecodePackBits** ([dng_stream](#) &stream, uint8 *dPtr, int32 dstCount)

7.42.1 Detailed Description

Support for DNG image reading.

7.43 dng_render.h File Reference

Classes

- class [dng_function_exposure_ramp](#)
Curve for pre-exposure-compensation adjustment based on noise floor, shadows, and highlight level.
- class [dng_function_exposure_tone](#)
Exposure compensation curve for a given compensation amount in stops using quadric for roll-off.
- class [dng_tone_curve_acr3_default](#)
Default ACR3 tone curve.
- class [dng_function_gamma_encode](#)
Encoding gamma curve for a given color space.
- class [dng_render](#)
Class used to render digital negative to displayable image.

7.43.1 Detailed Description

Classes for conversion of RAW data to final image.

7.44 dng_sdk_limits.h File Reference

Variables

- const uint32 [kMaxDNGPreviews](#) = 20
- const uint32 [kMaxSubIFDs](#) = [kMaxDNGPreviews](#) + 1
The maximum number of SubIFDs that will be parsed.
- const uint32 [kMaxChainedIFDs](#) = 10
The maximum number of chained IFDs that will be parsed.
- const uint32 [kMaxSamplesPerPixel](#) = 4
The maximum number of samples per pixel.
- const uint32 [kMaxColorPlanes](#) = [kMaxSamplesPerPixel](#)
Maximum number of color planes.
- const uint32 [kMaxCFAPattern](#) = 8
The maximum size of a CFA repeating pattern.
- const uint32 [kMaxBlackPattern](#) = 8
The maximum size of a black level repeating pattern.
- const uint32 [kMaxMaskedAreas](#) = 4
The maximum number of masked area rectangles.
- const uint32 [kMaxImageSide](#) = 65000
The maximum image size supported (pixels per side).
- const uint32 [kMaxMPThreads](#) = 8
Maximum number of MP threads for [dng_area_task](#) operations.

7.44.1 Detailed Description

Collection of constants detailing maximum values used in processing in the DNG SDK.

7.44.2 Variable Documentation

7.44.2.1 `const uint32 kMaxDNGPreviews = 20`

The maximum number of previews (in addition to the main IFD's thumbnail) that we support embedded in a DNG.

Referenced by `dng_image_writer::WriteDNG()`.

7.45 dng_string.h File Reference

Classes

- class [dng_string](#)

7.45.1 Detailed Description

Text string representation.

7.46 dng_temperature.h File Reference

Classes

- class [dng_temperature](#)

7.46.1 Detailed Description

Representation of color temperature and offset (tint) using black body radiator definition.

7.47 dng_tone_curve.h File Reference

Classes

- class [dng_tone_curve](#)

7.47.1 Detailed Description

Representation of 1-dimensional tone curve.

7.48 dng_xy_coord.h File Reference

Classes

- class [dng_xy_coord](#)

Functions

- [dng_xy_coord](#) **operator+** (const [dng_xy_coord](#) &A, const [dng_xy_coord](#) &B)
- [dng_xy_coord](#) **operator-** (const [dng_xy_coord](#) &A, const [dng_xy_coord](#) &B)

- [dng_xy_coord](#) **D50_xy_coord** ()
- [dng_xy_coord](#) **D55_xy_coord** ()
- [dng_xy_coord](#) **D65_xy_coord** ()
- [dng_xy_coord](#) **D75_xy_coord** ()
- [dng_xy_coord](#) **XYZtoXY** (const [dng_vector_3](#) &coord)
- [dng_vector_3](#) **XYtoXYZ** (const [dng_xy_coord](#) &coord)
- [dng_xy_coord](#) **PCStoXY** ()
- [dng_vector_3](#) **PCStoXYZ** ()

7.48.1 Detailed Description

Representation of colors in xy and XYZ coordinates.
